What you want ther can not be done by the AES event.
It can although be done with a special trick wich is described in 'Introducing ATARI ST machine code' by R.Pearson on page 347. I typed it over for you:

"One solution is to use the VDI call 'vex_butv'. Every time a mouse button is pressed we can pass a short routine to this call which it will run before GEM learns of the results of the button press. If the routine examines d0 it will find the result of the button press there, whether right, left, none, or both. If a right button is pressed we can pass a value to a symbol set aside for this purpose At the same time we can place a one in d0 so that GEM thinks a left mouse button has been pressed. As this is all done under on an interrupt basis it is transparent to our main program. Now all we have to do is to set up 'evnt_multi' or 'evnt_button' to look for a left button and when it drops through when we press the right mouse button we look at our holder to see whether a right mouse button has actually occured.

```
* Source code of new mouse handler so that we can use evnt_multi with
* it set to recognize right button press- evnt_multi can only recognize
* either a left OR a right button press.
* Install a new mouse handler that recognises the right mouse
* button using the vex_butv() VDI call. Mouse button status is same as
* vq_mouse() with values returned in d0. 0=no button 1=left, 2=right, 3=both
* Every time the right mouse button is pressed 'button_state'
* is passed a value of 1, and 1 is passed to the handler to simulate
* a left mouse button. This ensures that when the right button is
* pressed evnt_multi sees it as a left button press and we can use
* evnt_multi as usual. We then examine button state to see whether the
* right mouse button was pressed when we have fallen through evnt_multi.
* Zie introducing ATARI ST machine code blz. 347.
```

```
EXPORT   instal_R_mouse
EXPORT   deinstal_R_mouse
EXPORT   button_state

TEXT

install_R_mouse:

        move    #125,contrl
        move.w  #0,contrl+2
        move.w  #0,contrl+6
        move.w  gr_handle,contrl+12    ; physical screen device handle
        move.l  #new_mouse,contrl+14    ; address of new mouse handler
        jsr     vdi

        move.l  contrl+18,old_mouse_addr

deinstall_R_mouse:

       move    #125,contrl
       move.w  #0,contrl+2
       move.w  #0,contrl+6
       move.w  gr_handle,contrl+12
       move.l  old_mouse_addr,contrl+14
       jsr     vdi

new_mouse:
        cmpi.w  #2,d0          ; right button
        bne     nowt           ; was bne.s - not acceptable by zzSoft's asembler
        move    #1,button_state
        moveq   #1,d0          ; pretend it was left button
nowt:
        move.l  old_mouse_addr,-(sp)
        rts

DATA

button_state:          ds.w 1
old_mouse_addr:        ds.l 1
```

The 'new_mouse' routine should be installed at the start of our application. The old address of the routine can be found from 'contrl+18' and is placed in 'old_mouse_addr' for safe keeping. When our application exits back to the desktop we should de-install our new mouse handler and pass it the old mouse address via 'old_mouse_addr'

Now when 'event_multi' or 'event_button' is used, it should be set up to recognize a left mouse button event, and if the right mouse button is pressed it will think that a left mouse button event has occured. We should then examine 'button_state'

to see if a left or right button was pressed and then act accordingly. The value of button_state should always be set to zero after it has been examined after every 'evnt_multi/button' call, 'clr.w button_state' "

Although I am using this methode currently in a program I'am developing it is not neat programming, and I don't know what will happen in a multi tasking system. (got to check it myself) In a single task TOS sytem however it works fine. I've even got parts of it transformed to C.

regards, arjan

Yeah, what he said!

To avoid documentation snafus in C (really common,
given my standard coding technique), I usually use:

```
                              /* Mouse Button Designations  */
#define LEFT_BUTTON   0x0001
#define RIGHT_BUTTON  0x0002
#define MID_BUTTON    0x0004  /* Not Currently Available... */
#define EITHER_BUTTON 0x0100
```

then in the function, I'll build the mask I need by 'or'ing
the various numbers together:

```
mask = LEFT_BUTTON | RIGHT_BUTTON | EITHER_BUTTON ;

after which I plug 'mask' into the evnt_button
or evnt_multi call.

Hope this helps!

I have managed to make it work by "refreshing" the single toolstrip tree
when GEM messages 20 and 21 appear in @user_gem_messages() and by some
extra redrawing of the toolstrip objects at the beginning of
@user_window_content().

Great news even though multiple user-windows is a definite must IMHO. Any
thoughts on how I can upgrade my 1.1 version?

It is possible, via a _very_ poorly documented method that is described in
ProGEM by Tim Oren (get it at any good atari FTP site). It involves setting
some bits somewhere, I could look it up for you if you can't find ProGEM
("Professional GEM", try an AltaVista search for ("Tim Oren" +GEM) or
something...) You should get it anyway, as it's very useful when you want
to write good GEM programs...)

Sounds like the memory holding the title string is being "lost". Make
the string static or obtain it with a Malloc type call.

No doubt it is. If I had to choose one particular catagory of computer
programming as the "most impressive" it would be compiler writing.
(Perhaps because I wouldn't have a clue how to go about it!)

>PureC simply isn't an optimizing compiler.
>It seems to have a reasonably good code generator and a great register
>allocator, though (at least I've not seen it do anything really stupid

While I think of it. How recent are the GCC sources? I had a half
hearted look for some (for the compiler) but had no real success.

Agreed. There is of course the same problem with static arrays also so
I would assume both would be subject to the same rules.

>>>If Mwc is as bad as you seem to describe, you really should get GCC.

That's the approach I take. I don't like to be in a position where I
have to rely on optimisation to get the job done.

>>>Lattice claims it's an _error_ to declare local arrays 'register',

Never! :-)))

Tbh, I liked BBC Basic. It was way ahead of the others at the time,
the best bit being local variables.

So far ...

```
struct   {
int16    a;
int16    b;
}
```

'b' must have a greater address than 'a'. Fine, but so far we have nothing that prevents the compiler assigning 'a' a zero offset and 'b' an offset of 3024. It would be a very stupid compiler but nevertheless possible.

>A member of structure which is not
>a field is aligned on the memoryboundary of the type of the
>member."

Which unfortunately doesn't help your argument. 'unsigned char len' is a different type to that of 'char str[255]'. There is no reason for 'unsigned char' and '(signed) char' to use the same amount of memory, or for that matter, even be represented the same. Thus, it is possible for padding to occur between 'len' and 'str'. Highly unlikely I agree but still possible.

Even if both were 'char', 'len is a simple char and 'str' is an array of them and I'm not even sure you could guarantee one would directly follow the other. Here's what I'm thinking ... imagine some processor exists which can handle strings really efficiently but in order to do this it requires each char in the array to be word aligned. In this case you could find a padding byte between 'len' and 'str' to make the first char of 'str' word aligned (and each char would occupy a word of course with one byte 'ignored').

In any case, I'm (almost) certain that a negative array subscript is illegal. Again, I know we all use it but that isn't the issue.

>Wow, it's quit hard to translate stuff like this. Hope you
>still understand it.

I don't have the book so I hope you've got it right. I'm only going on what you said are the rules!

>My interpretation is that the standard
>requires that two subsequent chars in an struct are in memory
>just one char apart.

Assuming your interpretation is correct 'unsigned char', 'signed char' and arrays thereof are not the same so the rule does not apply - only that they be aligned according to their type.

>This makes it reasonable to suppose that all members of
>structures should be regarded as volatile.

Even if you ignore all the above what are the advantages of them being
volatile against the disadvantages. In turn, what are the advantages
or them not being volatile against the advantages?

>> Can you think of something else a bit more legal? <G>
>
>I think is _IS_ legal.

I'm not saying you are wrong. It's simply that I see more
disadvantages to them being volatile than not.

It is unfortunate. As was said (iirc by Johan) non of the atari
compilers are ansi conforming. Actually, Mwc does adhere, but only to
the draft standard as there was no standard per se at the time. The
'volatile' keyword is allowed but that is all - it has no meaning
otherwise I could do some tests. :-(

I can only think of one - that would be where the caller/program relied on vst_loadfonts() in order to decide to continue or not. This could be overcome by having vst_loadfonts() look for bitmap fonts and return how many there were. The fact that they had already been loaded would be irrelevent then.

>(that's needed for rendered vector font characters anyway).

That seems reasonable. There's only one small problem I can think of and that's where a program has used vst_loadfonts() above then the situation arises where there is not enough memory to display a given bitmap font - the program will naturally assume it can use all the bitmaps because they have already been loaded. You would therefore need to ensure fVDI always maintains at least enough memory to process the largest bitmap (you've probably thought of this anyway). Other than that the idea to leave bitmap data unloaded until needed is a good one. :-)

I'm pretty sure vst_loadfonts() does not know about vector fonts under
Nvdi 3.x at least. It only returns the number of bitmap fonts it
loaded.

Oh well. Maybe one day one of us will find out which of non volatile and volatile is the case.

>Admittedly the resulting code is not platform independent, but there

I have a tendancy to agree with that. ;-)

I definately agree with this. I've a distinct feeling the #ifdef etc code comes about simply because the author had access to all the machines involved. I say this because of the number of times such code has failed when it is documented to work - and the bug invariably turns out to be due to *newer* 'portable' modifications.

Yeah but iirc v_opnvwk() only returns the system font and I don't
think vq_extnd() gets updated. Again under Nvdi 3.x

Does somebody know for sure else I guess it looks like I'm going to
have to re-experiment.

If memory serves, vst_loadfonts() does not return vector font
information under Nvdi 3.x thus I used vqt_name() which knows about
both. Whether this is specific to Nvdi or documented (or some better
way is available) is another matter.

How 'alive' is the Falcon, how many _active_ coders of both real
utilities and demos are there? I inquire because I've just bought one,
and am interested in using the DSP and possibly doing some composing.

Can people give me a lovely warm feeling, an mail me to tell me what
kinds of stuff they write, and what tools they use?

Hi, Just wanted to throw my hand in the air and shout; I'm coding for the
Atari!! But it's not Falcon spesific :)

Take Care

s >
s > then in the function, I'll build the mask I need by 'or'ing
s > the various numbers together:
s >
s > mask = LEFT_BUTTON | RIGHT_BUTTON | EITHER_BUTTON ;

Actually it's bclicks, not bmask, that should have bit 8 set.

What this does is change the logic from returning when (button &
bmask == bstate) to returning when (button & mask != bstate). So to
return when either button is clicked you need

```
bclicks = 0x101;
bmask = 3;
bstate = 0;
```

>
> after which I plug 'mask' into the evnt_button
> or evnt_multi call.
```

Although this gives the desired effect, it is fairly confusing, as the underlying semantics is not followed.

The semantics of evnt_button is that mask specifies which events must occur all *at once* to trigger the event. This means, setting both the mask and the state to three means, the left button must be pressed, *AND* the right button must be pressed, in order to trigger evnt_button. Correspondingly, with a three button mouse system, a mask of seven would specify all three buttons to be pressed.

Now what Atari never officially documented is that setting bit 8 does not specify button 8 on an imaginary 8 button mouse, but to INVERT the condition upon which then event triggers. So instead of having the call trigger on

```
        (Left_Mouse AND Right_Mouse),
```

which means Left and Right must be down (pressed, clicked), setting bit 8 achieves triggering on

```
    NOT (Left_Mouse AND Right_Mouse)
```

Booleans arithmetics tells you the latter being equivalent to

```
    (NOT Left_Mouse) OR (NOT Right_Mouse)
```

Now you ended up with the desired OR in the middle, i.e. triggering on the left button OR the right button. However, since there are still those NOTs, you need to set the state to zero, i.e. button NOT pressed.

This is a lot of mathbabble, in more common language it is this :

evnt_button can only ever test for ANDed conditions. Full Stop.
Using evnt_button(1, 3, 3) (i.e. mask = state = 3) one tests for both buttons (mask = 3) pressed (state = 3) at the same time. Since you rarely press both buttons at once, you need instead to test for the contrary condition, i.e. both buttons NOT pressed (state = 0). This leads to evnt_button(1, 3, 0). This will lead to trigger the event whenever both buttons are released, and remains untriggered as long as one (any one)

of the buttons is pressed. This is close, but not quite the desired effect.
The wanted effect was to invert the behaviour, i.e. *trigger* it if any
botton is pressed, and remain untriggered as long as neither button is
pressed. To achieve this inverting, one has to set bit 8 of the mask,
i.e. use evnt_button(1, 256 + 3, 0)

Keeping this semantics in mind, you can construct calls that wait for more
complex situations too.

```
>>Ok, here it is....

pres

Don't ever do that ! This is very bad stuff. While using AES, the screen
workstation belongs to the AES. While there is a mechanism for sharing
output to the same workstation (virtual workstations), this cannot be done
for input ! The reason is quite obvious. A program doing that would steal
input that was meant to be processed by the AES. While this can still be
managed within the own application by tricky usage of semaphores or similar
stuff, the program will badly fail in a multitasking environment. Other
programs that are supposed to work in parallel, cannot be operated anymore,
mouseclicks supposed to do something in some window or dialog are without
effect suddenly, because that bad stuff in the background steals them.

So please refrain from this.

I'll put this book by Pearson on my black list of bad books recommending
silly, non-portable, specs-violating methods. It's sometimes depressing
to see how much bad stuff is there, the authors of which apparently never
read the tiniest bit of Atari's specifications on how things are supposed
to be done.

It's actually worse. It will give problems under single-tasking as well
as soon as accessories are used.

> "One solution is to use the VDI call 'vex_butv'. Every time a mouse button is
pressed we can pass a short routine to this call which it will run before GEM
learns of the results of the button press. If the routine examines d0 it will find
the result of
the button press there, whether right, left, none, or both. If a right button is

pressed we can pass a value to a symbol set aside for this purpose At the same time we can place a one in d0 so that GEM thinks a left mouse button has been pressed. As this
i
s all done under on an interrupt basis it is transparent to our main program. Now all we have to do is to set up 'evnt_multi' or 'evnt_button' to look for a left button and when it drops through when we press the right mouse button we look at our holder t
o see whether a right mouse button has actually occured.

Can't you configure your news reader to write proper Usenet compliant output ?? This is truely annoying. Either reconfigure it, or refrain from using ASH Emailer in the first place.

Cheers Peter

I was quoting from the Holy Compendium, page 6.61, which states:

WORD evnt_button(clicks, mask, state, mx, my, button, kstate)

[...]

COMMENTS A previously undocumented feature of this call is accessed by logically OR'ing the _mask_ parameter with 0x100. This causes the call to return when independent buttons are depressed. For example, a _mask_ value of 0x03 will return when both the left and right mouse buttons are depressed. A _mask_ value of 0x103 will cause the call to return when either button is pressed.

------ end of quote, underlines as-shown in the text ------

That method using bclicks is intriguing ... and worth
experimenting with the next time I've got free time!

I don't think this is true. vst_load_fonts returns vecter fonts as
well. You should use vqt_f_name to get the names of vector fonts. I
can't be certain since I don't have NVDI 3, but I do know that vector
fonts are returned with vst_load_fonts under speedo and under NVDI 4.

I'm not 100% sure what you mean actually!

One thing to be very careful about is ensuring you don't make such
changes as to cause the resource editor to rearrange any of its trees.
Copying items from another resource will almost certainly cause this
to happen. Ideally you should limit yourself to retyping the german as
english and don't drag any objects about. Also try to keep the strings
the same length - this rarely matters but you don't know what the
program's requirements are. The only way to be 100% certain you can
find the problems is to make one change at a time then test it by
running the program. Tedious but a fact!

From a programming point of view, not much if each cpu is programmed in 'user' mode - the 68030 understands all the instructions the 68000 does so 68000 docs will do fine to start with.

In supervisor mode there are differences. You will need supervisor mode if you want to access the hardware directly. I don't have a 68030 machine so I'll leave the details for someone else to explain ...

Here's how to do it with evnt_multi() ...

Set argument 2 (clicks) to clicks OR 0x100 (eg 0x102).
Set argument 3 (button) to 0x003.
Set argument 4 (bstate) to 0x000.

... and you will get left/right button single and double clicks detected and returned (interrogate the button state and number of clicks on output).

By masking 0x100 into clicks you have told evnt_multi() to invert what it is looking for and by setting bstate to zero you have told it to wait for both buttons up (ie inverted). Thus rather than it waiting for

```
A.B
```

it is now waiting for

```
---
- -
A.B
```

which works out the same as

```
- -
- -
A+B
```

which reduces to

```
A+B
```

Not entirely true: MOVE SR,<ea> is a user mode instruction on the
68000, but requires supervisor mode on the 68030.

Try this:

```
struct {
  unsigned char len [256]
  char *str
}
/* init */

str = (char*) &(len[1])
...
```

Now your pascal.str[-1] hack will work.

Thanks Guy,
That is exactally what I was doing, and sure enough, the problem you
mention might happen did:). After several "test" I am finding the bugs
I introduced, and things are going well.

Regards,

Mike

Looks like I'd better knock up a little test program to make sure I'm
correct ...

... Hmm, vst_loadfonts returns the number of fonts (minus the system
one). Looks like I was wrong so apologies to everyone!!!

I've some trouble with initialising the sound-system.
I tried to code in C a little delay, but the Falcon records only a feedback tone.
I think some devinitions at <falcon.h> are wrong.

Wat is the good initialisation voor recording and playing?
Is it possible to record one track while plaback an other?

Note that Interface has a special feature that locks objects, e.g. you can't do any changes to a resource file which would affect object numbering. It's called something like "Objektnummern fest" in the German version and is a menu entry of its own.

Ciao

Thomas

You just have to persevere! I haven't written a program from scratch
in years. I just bolt together code I've written in the past then add
to it - that's the secret. ;-)

>>>I *hate* it!
>>
>>Naa! There's always a way round everything. Don't draw the icon if

>>
>
>Hows that done in GFA then? I know you can do it.

You really only need a way of getting at memory whilst in supervisor
mode so you'd probably find the Gfa PEEK command would be suitable.

The cookie jar is just an array which can be anywhere in memory. To
find where it is in memory you look in location $5A0. The long (32
bit) value there is the base address of the array. After that, all you
do is look in each array element in turn until you either find what
you are looking for or get to the end of the array.

A cookie consists of two long values. The first long value is the
cookie name. The second long value can be anything - it depends on the
cookie.

Afaik, Gfa does not possess structures which makes it a doddle. As
just about all docs are in C then knowing about structures enables you
to simulate them. Bear with me because this can be applied to any
language with structures such as Pascal for example.

To simulate a structure you need to know how many bytes each one takes
up. This is reasonably easy on the atari. A 'long' takes 4 bytes, a
'short' takes 2 bytes and a 'char' takes 1 byte (with a problem I'm
ignoring because it is irrelevent here). The only complication is how
much space an 'int' takes up. On some compilers they take 2 bytes, on
others they take 4 bytes. This isn't a problem with manuals etc
because they tend to use LONG (4 bytes), WORD (2 bytes), and CHAR or
BYTE (1 byte).

The following is how just one cookie would look like in a manual using

C ...

```
typedef struct     {
LONG cookie_name;
LONG cookie_value;
}    COOKIE;
```

COOKIE contains two LONGs which means it takes 8 bytes of memory. If COOKIE happened to be stored at memory location $100 then it would use up memory locations $100,$101,$102,$103,$104,$105,$106,$107. cookie_name comes first so it takes up the first four $100,$101,$102,$103 and cookie_value comes next so it takes up $104,$105,$106,$107 and that is all we need to know to write the code in Gfa.

Now, I don't know any Gfa and it's years since I did any Basic so I'm going to assume these commands exist ...

LPEEK(memory_location) This command enters supervisor mode, reads the contents of 'memory_location' reverts back to user mode, then returns the LONG value that is there back to the caller. Also a similar command PEEK(memory_location) which just returns a BYTE.

```
rem find cookie array
base = LPEEK($5A0)

done = 0
WHILE (done = 0)
     name = LPEEK(base)
     IF (name <> 0)     THEN
          IF   (PEEK(base+0) = ASC('M')) AND
               (PEEK(base+1) = ASC('A')) AND
               (PEEK(base+2) = ASC('G')) AND
               (PEEK(base+3) = ASC('X')) THEN

               done = 1
               value = LPEEK(base+4)
          ENDIF
     ELSE done = 2

     rem offset to next cookie in array
     base = base + 8
ENDWHILE
```

'done' will be 2 if the end of the cookie jar was reached without finding the MAGX cookie (the last entry has a name which is zero) otherwise 'done' will be 1 and 'value' will contain the MAGX cookie's value.

>>Actually, it wouldn't surprise me if the other multitasking systems do
>>the same thing with the menubar (but I don't know) in which case you

>>and only enabling the icon if it is 1.

>
>erm.. Whatever. :-)

Each Gem application has a header block whose name I cannot remember.
One of the entries in it says how many processes this particular
version of Gem in capable of running at the same time (concurrent).
Normal Gem has this set to 1 because it can only run one main
application (accessories do not count). Geneva and MagiC etc will have
a higher value.

>>Even simpler is to have an option in the menubar to turn the feature
>>on and off. See lots of solutions! ;-))
>>
>
>I could do that.

And debugging any compiled language is a bit of a pain.

> >To check for any version of magic is easy. Simply scan the cookie jar
> >for a cookie named 'MAGX' without the quotes.
                      ^^^^
To check for Magic requires a search for the 'MagX' cookie. And once you've found it, it's anyones guess what the value means. It isn't the version number, although it may be a pointer to a structure that contains it.

> Hows that done in GFA then? I know you can do it.

How about something like this:

```
FUNCTION find_cookie(cookie$,VAR value%)    ! wanted cookie in cookie$,
  '                                         ! value returned in value%
  LOCAL cookie.address%,temp1%,temp2%,exit!
  IF LEN(cookie$)<>4                        ! if the cookie length isn't 4,
    cookie$=LEFT$(cookie$+SPACE$(4),4)      ! pad with spaces. Should really
  ENDIF                                     ! be a search error since it
  '                                         ! should be 4 chars.
  '
  cookie.address%=LPEEK(&H5A0)              ! get address of cookie jar
  IF cookie.address%=0                      ! if 0 then doesn't exist
    RETURN -1                               ! and return -1 to say so
  ENDIF
  exit!=FALSE
  DO
    EXIT IF LPEEK(cookie.address%)=0        ! 0 (NULL) marks end of list
    temp1%=LPEEK(cookie.address%)           ! the cookie
    temp2%=LPEEK(cookie.address%+4)         ! the value
    ADD cookie.address%,8                   ! set to address of next cookie
    IF MKL$(temp1%)=cookie$                 ! check if the cookie is the
      '                                     ! wanted one.
      '
      value%=temp2%                         ! if it is, get the value,
      exit!=TRUE                            ! say it's been found
    ENDIF
    EXIT IF exit!                           ! and exit the search loop
  LOOP
  RETURN ABS(exit!)                         ! finally returning 1 if found,
  '                                         ! or 0 if not.
ENDFUNC

Hi, all. I need to know what the call VQT_NAME() returns if you pass it an index higher than the actual number of loaded fonts. Is there a way to make it return the number of loaded fonts? Or is there some other call that does that besides VST_LOADFONTS() ? Anyone?

Until next time... Take Care ;-)

That must be because PureC is using A2 then. Gemdos trashes d0-d2/a0-a2 (and a6 in one LineA call!).

>    if(pascal.len != (unsigned) pascal.str[-1]) abort();
```

I'm afraid this is not valid for our discussion. The compiler does not know that pascal.len and pascal.str[-1] are the same thing and would require both to be treated as volatile in order to work. Having seemingly agreed with you I'm afraid there is another reason why it would work by accident - sequence points.

>This is not a case of array overflow,

It is. If you think about it, there is no guarantee pascal.len will

exist in the byte before pascal.str[0] because the compiler is at
liberty to use padding in a structure if it wants.

>Now it may be possible to make a compiler smart enough to handle the
>above using registers, but a clever enough programmer is bound to
>find something the compiler can't handle correctly (e.g. Lattice C).

The purpose of "sequence points" are to ensure the state of any two
conforming compilers are similar at those points. As I understand it,
this does not mean that (say) pascal.len must *contain* the correct
value at a sequence point. Rather pascal.len must *behave* as though
it contains the correct value at a sequence point. Not the same thing
as it leaves the compiler free to do whatever it likes reguards
storage.

Thus pascal.len=4 may or may not result in the value 4 being stored
within pascal.len, it only means that when the value 3 gets assigned
to pascal.str[-1] that the correct 'holder' of '4' (ie register) gets
updated with its new value of 3 - except it doesn't ... ;-)

... as far as the compiler is concerned with the above example,
pascal.str[-1] is not pascal.len so it has no obligation to update
pascal.len when you assign 3 to pascal.str[-1], it is only obliged to
maintain the two independant values you have told it about. If both
are in registers then there is no way to tell which one will end up
finally being stored in pascal.len.

The easiest way by far to cope with sequence points is to ensure the
lvalues get updated on reaching one. This unfortunately has exactly
the same effect here as if they were being treated as volatile. Thus,
I have no way of disproving anything if it happens to work!

Can you think of something else a bit more legal? <G>

Remember that only GCC has been updated anything like recently!

```

Mwc flags it as a warning also. I've no idea what the standard says but offhand I can't see any reason why a compiler couldn't use a register if it wanted to.

```

>If Mwc is as bad as you seem to describe, you really should get GCC.
```

It's not bad, it's just old and doesn't do much in the way of optimisation. Actually, I have it set so it does no optimisation at all. That way I get no surprises and I know what code it is generating so I can usually get my optimisation done simply by declaring things in a certain way. Plus I can hand optimise the assembly if I really need to (which is very rare).

```
>This is what Lattice C produces with 32 bit integers and the best

Mwc will always produce link,unlk,rts for a dummy function.

It may well be right but calling it an error rather than a warning could be a little extreme, especially when it has done just that in its optimisation by using a0 and a1!

```

Rather clever in one sense but also one of the reasons I dislike
optimisation. If I put useless code into a program then I expect it to
stay there. All in my opinion of course! ;-)

I assume you at least got a warning about it and could turn it off if
you wanted?

It is, and I can't for the life of me get it to do this atm - but I
know it has done this or similar in the past on more than one
occasion. Typical Sod's Law!

>The only reasonable way is to do what every normal C compiler does:
>Let the called function make sure that it doesn't modify any registers

Yep.

>The reason it's done this way is of course that the caller has no way of
>knowing what registers the called function is going to need.

Yes.

Perhaps I got it slightly wrong. It may have been that it unstacked
the register variables and restored the stack before making the
function call then stacked the registers and reloaded them after the
call. I only remember thinking it was a really stupid thing to do.
Anyway, I can't get it to do it at all now. Perhaps it was a "feature"
of one of the older mwc versions.

No. The bombs tell you what type of crash happened to the atari.

>Does anybody know something about it?

If it happens when the same program(s) are running or some sort of
pattern like that can be established then it is most likely a bug in
one of the programs.

If there is no pattern at all to when it happens (or it seems time or
heat related) then it might possibly be a hardware problem.

Newsgroups: comp.sys.atari.programmer

Hello everybody,

I have released the March revision of my program Eureka 2.12.
It's designed to draw graphs and surfaces in 3D. It exports
various 3D formats including VRML 1 and 2. This program is
tested on various ATARI platforms and emulators and is
developed on my HADES 060. It is available on my home page
at :
http://www.ief.u-psud.fr/~lecoat
and on karl SAMYN's FTP at RMA (Belgium) :
ftp://193.190.205.13/archive/atari/
on mathematics directory.
Karl is maintaining the English documentation, and a new
revision is available till now, every month on both sites.
If you have any remark, I would be interested.
This program is also ditributed under Cyberstrider scheme.
Have fun with it.
Regards,

No problems at all with GCC (well, except for an unusable library at first
when I left the default -g option in the makefile).

>divide by zero error at Div64by32 function. I think that the code is not 100%
>sizeof int independent.

GCC has long long, which I assume was used for those functions.

>Needless to say I have defined SIZEOF_INT 2 at ft_conf.h

As I'm sure you know, it's not unusual for UNIX code to dislike 16 bit ints.
PureC seems to have more than its share of such problems.

I thought I saw it mentioned somewhere in the code/docs that you could do
without that function, with some loss of precision. Anyway, you should be
able to write a replacement in assembly relatively easy.

>Panayiotis Andriopoulos (yes, the JPEGD one ;-)

Ah! Hi! (No wonder I can never seem to remember your name. ;-)

I guess you've seen that people are still doing new attempts at reverse
engineering JPEGD? I'm pretty sure you were the first, though. ;-)

I don't agree with you, quoting K&R2 page (translated to dutch,
retranslated by me, but englisch pages 214-214):
"Members of a structure have ascending adresses in the order
they have been declared. A member of structure which is not
a field is aligned on the memoryboundary of the type of the
member."

Wow, it's quit hard to translate stuff like this. Hope you
still understand it. My interpretation is that the standard
requires that two subsequent chars in an struct are in memory
just one char apart.

This makes it reasonable to suppose that all members of
structures should be regarded as volatile.

> Can you think of something else a bit more legal? <G>

I think is _IS_ legal.

Hans

This isn't about recent updates. Optimization techniques like this have
been used since the very first compilers were written.
It's basic textbook stuff.

PureC simply isn't an optimizing compiler.
It seems to have a reasonably good code generator and a great register
allocator, though (at least I've not seen it do anything really stupid
with the registers, unlike some other compilers).

>>>Hmm. Good job I ran it through Mwc. It won't let me bind any sort of

>

>Mwc flags it as a warning also. I've no idea what the standard says
>but offhand I can't see any reason why a compiler couldn't use a
>register if it wanted to.

Naturally, the compiler could use a register. The question is if it's actually legal to use the register keyword for a local array. That would depend on what the standard has to say, which definitely isn't always obvious. None of the Atari compilers are ANSI certified, however, so I guess we should not believe any of them.

>>If Mwc is as bad as you seem to describe, you really should get GCC.
>
>It's not bad, it's just old and doesn't do much in the way of
>optimisation. Actually, I have it set so it does no optimisation at

Well, I guess it depends on your definition of 'bad'. I didn't mean to imply that it produced faulty code, just inefficient code.

>all. That way I get no surprises and I know what code it is generating
>so I can usually get my optimisation done simply by declaring things
>in a certain way. Plus I can hand optimise the assembly if I really

I much prefer writing readable code to tailoring it for specific compilers/processors. That's not saying I don't do it too, however. ;-)

>>Lattice claims it's an _error_ to declare local arrays 'register',

>
>It may well be right but calling it an error rather than a warning
>could be a little extreme, especially when it has done just that in
>its optimisation by using a0 and a1!

Lattice C may well be right, though, you know.
Programming language standards can be very mysterious at times.

```

```

>>Lattice C is very fond of strength reduction (that's what this kind of
>>optimization is called).
>
>Can you explain that in more detail?

Strength reduction - the replacement of an expensive operation (the array index calculation) by a cheap one (an addition).
As you could see below, GCC does this as well, but Lattice adds some

'induction variable elimination', to get rid of the unneeded 'i' and 'j',
which adds the final icing on the cake. ;-)

Lattice can get silly with this sometimes, though. I once had some kind
array clear loop, which was supposed to clear a long word at a time.
Lattice happily got rid of the index variable, but changed the loop to
clear a _byte_ at a time...

>> jbsr _foo
>>
>>Nothing strange here.
>>With another version of 68k-gcc I tried, I actually managed to get rid

>>discovered that it did nothing.
>
>Rather clever in one sense but also one of the reasons I dislike
>optimisation. If I put useless code into a program then I expect it to
>stay there. All in my opinion of course! ;-)

I'm happy as long as the code still does what it's supposed to do.
If I tell the computer to do nothing, I expect it done very swiftly. ;-)

>I assume you at least got a warning about it and could turn it off if
>you wanted?

There's no reason to warn about it (the function was still there in
its original form in case it got called from outside that module).

It only happened with -O3 (highest optimization setting), however, which
I don't normally use (it's not always better than -O2).
GCC also has a gazillion optimization flags, so I'm pretty sure there's
an -fno-inline-functions to complement -finline-functions.

Sod's Law. I wrote MagX down in the code below and MAGX up here. Being
too lazy to walk across the room and check I guessed which it was
(rather than have it made obvious I was too lazy to check by writing
MagX in one place and MAGX in another). ;-))

>And once you've
>found it, it's anyones guess what the value means. It isn't the version
>number, although it may be a pointer to a structure that contains it.

Correct about it being a pointer and there is rather a lot of it.

It is defined thus as per the magx.h that came with MagiC2 plus a bit
added by me that was in the v2 manual but not in the structure ...

```
typedef struct     {
long config_status;
DOSVARS   *dosvars;
AESVARS   *aesvars;
}    MAGX_COOKIE;
```

ie the above MAGX_COOKIE structure is what the cookie value points to.

```
typedef struct
   {
   char      *in_dos;                /* Adresse der DOS- Semaphore */
   int       *dos_time;              /* Adresse der DOS- Zeit      */
   int       *dos_date;              /* Adresse des DOS- Datums    */
   long      res1;                   /*                            */
   long      res2;                   /*                            */
   long      res3;                   /* ist 0L                     */
   ptr      *act_pd;                /* Laufendes Programm         */
   long      res4;                   /*                            */

Actually, all computer games are 2D because the CRT has a disply that
is is only two dimensions. In order to be true 3D, one would have to
use one of the available stereoscopic methods like LCD shutter glasses
and such with it.

Hehehe.

No, that cannot be theoretically possible because the Phosphers on the
CRT must be a few molecules thick, hence they are 3D, therefore the 2D

game is really 3D. My theory on this would only make sense if you are a cheap skate video game company trying to make money by calling 2D games 3D. I wonder if it could be argued in court ;) Think of it this way most CRTs are not flat, they are rounded meaning they are actually 3D. The phosphers must be 3D anyway you put it because they have some height width and depth. Therefore the phosphors are 3D. If you display something on 3D it must be 3D. The CRT itself is also not flat, the electron gun sticks out the back, but relating the fact that a 3D setup is projecting images than the image must be deduction be 3D. Pretty interesting theory isnt it? Now I need someone to argue the 1D games for me...

g > Can you think of something else a bit more legal? <G>

Just variations on the same theme: taking advantage of the relative locations in RAM for members of data structures, arrays and unions and accessing them via pointers or array indexes in a non-obvious manner.

Admittedly the resulting code is not platform independent, but there is a place for platform dependent code. (My dictionary defines machine independent code as code which will not work on any machine.)

Looking at the giant kludge of #ifdef/#endif statements in what passes for portable code, I would prefer to have non-portable code I can read and modify for my platform than unreadable code which works on hundreds of platforms (but not mine).

Thats probably 5,000,000 'marketing polygons'... =)

The system font index.

>Is there a way to
>make it return the number of loaded fonts?

Yes, you can figure it out with this call.

>Or is there some other call
>that does that besides VST_LOADFONTS()?

I don't know the actual documentation on this but with Nvdi
vst_loadfonts() only applies to bitmap fonts. Vector fonts can be used
reguardless of whether you call vst_loadfonts() beforehand or not.

>Anyone?

I can't remember the exact details offhand but a simple test program will sort it out for you. Just do something like this ...

```
for (i = a; i < x; i++) {
     id = vqt_name(handle,i,buffer[32])
     /* print vqt_name details */
}
```

... where 'x' is a bit bigger than the number of fonts currently loaded on the system. You'll see that once it runs out of font's it repeatedly returns the system font and its index. You'll also get a value for 'a' (use zero for the test above).

Whenever I click on the move bar of a window in TOS 4.04, the window title is erased. The only way to redisplay the window title is to go through the wind_set(win_handle, WF_NAME, ADDR(default_name) process again.

None of the OS windows erase the title during movement, and none of the third-party windows do either.

What do I do after wind_set() to tell the OS not to erase the window title during movement?

Thank you!

: > Hows that done in GFA then? I know you can do it.

: How about something like this:

: FUNCTION find_cookie(cookie$,VAR value%)   ! wanted cookie in cookie$,
: <stuff>

Well, that's more or less what I did as well:

```
CLS
~FN find_cookie("*")   ! Just for testing
~INP(2)
END
'
FUNCTION find_cookie(string$)        ! This is the actual function
  LOCAL jar,id,counter&,value
  jar=LPEEK(&H5A0)                     ! Get Cookie Jar address
  REPEAT                               ! Loop to check all cookies
    id=LPEEK(jar+counter&)             ! Get cookie ID (name)
    value=LPEEK(jar+counter&+4)        ! Get cookie value
    ADD counter&,8                     ! Next cookie
    IF MKL$(id)=string$                ! If cookie matches string...
      RETURN value                     ! Return cookie value
      ' ----------------------------------  You don't really need this bit
    ELSE IF string$="*"                 ! "Wildcard", prints all cookies
      IF id=0                           ! Check for NULL cookie
        PRINT "NULL"                    ! End of list
```

```
        PRINT "------------------------"
        PRINT "Jar size:"'value'"slots"  ! Print jar size
      ELSE
        PRINT MKL$(id),"$";HEX$(value)   ! Print cookie and value
      ENDIF
      ' ----------------------------------
    ENDIF
  UNTIL id=0                            ! Until NULL cookie (end of jar)
  RETURN 0                              ! Cookie not found
ENDFUNC
```

I wrote a command shell in GfA once (I know, sick idea, but it actually worked pretty well...) and used this routine. When digging it up yesterday I discovered some bugs in it though... ;-)

Yep, but the caller application (eg. the desktop) should take care of that
if needed. Unfortunately, as I said before, the GEM Desktop is not very
bright... (replacement desktops usually do have this option)
It may be possible to install a "viewer" program for .TOS and .TTP files
in the DESKTOP.INF. This program could ask for a commandline if needed
(maybe even using XARG, so we can get a decent commandline length!),
run the "client" program with the specified commandline, and pause after the
"client" has quit.

Or use the utility you mentioned. ;-)

One undocumented thing about the way wind_set() works in Atari's AES: The arguments you pass to it for WF_NAME and WF_INFO must be static. In C, you should declare them as global rather than as part of the function, so this:

```
void settitle( char *string ) {
   wind_set( handle, WF_NAME, string );
}
```

needs to be more like this:

```
char title[100];
void settitle( char *string ) {
   strcpy( title, string );
   wind_set( handle, WF_NAME, title );
}
```

>>   for (i = 0; i < ii; i += 1)
>>   {
>>     a[i][j] = b[i][j];
>>     foo();
>>    }
>>  }
>>  return 0;
>>}
```

Hmmm, what about

```
int main (void)
{
   int  a[8][8], b[8][8];

   memcpy (& a[0][0], & b[0][0], 8 * 8 * sizeof(int));

   return 0;
 }
```

;-))

Cheers Peter

I'm pretty sure they indeed do that. A better check is inquiring the
global[1] entry after calling appl_init();

I suspect your "default_name" is some local variable or similar,
i.e. some storage that is volatile. Note the wind_set stores
only the address, if the storage is reused by the program, the
title string will vanish (or get replaced by rubbish) as soon
as the AES are about to redraw the window title.

re: 3d vs 2d...

Your argument regarding "since the projecting apparatusis 3d,
then the image must be 3d" breaks down when you consider a
slide projector. When it projects an image to a theoretically
perfect screen, the image itself has no depth unless you look
at light as a particle. But so far we have not been able to
resolve the particle/wave dispute. My own idea is that it is
something _else_, that we as humans in our particular frame of
reference cannot see it as it is. Perhaps it is 4-D or more in
nature, and humand find it difficult at best to perceive more
than 3 simultaneous dimensions.

I don't really know as I never wanted to know the name of a font
that wasn't there.:-) Why not just try it and see? Is there some
reason why you can't use VST_LOADFONTS?

I'm sorry about that. It was originally suppose to be for high res as
well, but my mono monitor bit the dust so I have no way of testing the
global coordinates. Perhaps when I get some extra time on my hands I'll
try to make compatible in high res. Thanks for given it a whirl though,
its my first program.

Scott.

It's always the case that when you can't be bothered to check something,
what you think it is isn't what it should be. Or that's what I usually find
anyway :(

> >And once you've
> >found it, it's anyones guess what the value means. It isn't the version

<snipped a lot of useful info>

Looks like you're becoming a goldmine of information. First it's the
40 folder bug, now magic. What else is hiding up that sleeve of yours?

> /*
> The following have been added from the manual by me as this header
> seems a bit out of date. The version and release work anyway!

```
> */

>      *reservd2,
>      *reservd3;
>     int   version;
>     int   release;
```

Works with mine as well. This means that

```
version#=0
release&=0
SELECT @find_cookie("MagX",value)
CASE -1
  ~FORM_ALERT(1,"[3][No cookie jar found][Okay]")
CASE 0
  ~FORM_ALERT(1,"[3][Cookie jar present,|although Magic isn't!][Okay]")
CASE 1
  a=LPEEK(value+8)
  version#=VAL(HEX$(DPEEK(a+48)))/100
  release&=DPEEK(a+50)
  a$="version is "+STR$(version#)+"|release "+STR$(release&)
  ~FORM_ALERT(1,"[0][Magic is present.|"+a$+"][Okay]")
ENDSELECT
```

will display an alert with the correct version/release of Magic, if it's present.

> Hey cool, my pseudoGFA wasn't a million miles removed! <G>

Not that far off. We'll have you programming in Basic before long. <VBG>

I'm just a little bitter from what I consider being betrayed by the
Trammels. After hearing so many times that 'this year' would be 'the
year of Atari' only to see them only market in the New York City area
or maybe a couple of other local areas, it burns me up. I tried to do
my part by buying hundreds of dollars worth of hardware and software
only to see it become worthless as fewer and fewer places supported
the platform. I hate being at the mercy of Microsoft. But what's the
alternative? Even the Mac may not last much longer. I suppose if my
needs were simpler, I could get by with my old 520 ST running Word Up
etc., but for my needs, it won't do. There- I got that off my chest.

Tim

Would there ever be a problem if all fonts are made available even
without a vst_loadfonts() call?

I've not really used VDI fonts before (only for my rotated font output
in MGIF) and have been thinking about how to deal with this in fVDI.

Currently all specified fonts are loaded at startup and are then
immediately available (has anyone run into any problems with this?).
If there are lots of fonts this is of course not such a good idea, but
then neither is loading everything at vst_loadfonts().
In fact, vst_loadfonts() doesn't really make much sense in a multitasking
environment, since the fonts may very well be loaded by another
application already, anyway (fonts are read-only and therefore global).

What I'm planning to do is set up a font structure for every specified
font, but not load the actual data until the font is actually used.
Font data will also be unloaded later using some kind of cache algorithm
(that's needed for rendered vector font characters anyway).

I've done a lot of programming on my Atari ST. If I want to print to the
printer I open a file as follows-

fp=fopen("PRT:", "w")

Then I can use the fprintf() command to print to the printer.

But now I'm trying to learn C on my PC. The above command won't work. One old C book suggests using a constant of "prn" and another shows the use of PRN, but those don't work either.

I'm using MS VC++. First I'm just trying to enter and compile some simple files out of books, as I haven't programmed on the Atari in 4 years so I'm rusty.

So, how the hell do you print to a printer with a PC?

As long as we're addressing printing techniques,
where is the SpeedoGDOS manual for programmers?
Is it kept online somewhere? It'd be kinda nice
to use all those neat fonts when outputting.

Thanks!

It does work in high res if you patch the program code. It will even work in ST low, but some of the dialogs don't quite fit, and the info bar at the top of the screen is a bit cramped. Looking at it, it seems as though you've done the following:

```
IF XBIOS(4)-1
  ' tell the user it only works in medium res.
  ' clear up and quit
ELSE
  ' continue with the program as normal.
ENDIF
```

If you change the XBIOS(4)-1 to XBIOS(4)=0, ie so it isn't tried in ST low, it should work. Then again, you could use:

```
IF WORK_OUT(0)<639 OR WORK_OUT(1)<199  ! this is the width/height of ST
  '                                    ! medium res
  ' inform the user the screen res
  ' should be higher and exit
ELSE
  ' continue
```

This would then make the program more machine/mode independant and allow

it's use on Falcons/TTs and above.

As for the version that you distributed, the change is at an offset of $38A (906) bytes from the start of the file. With a disc editor, look for the following at offset $380:

3F3C 0004 548F 5380 6738 4EB9

If you change the $67 to a $6C (BEQ.S $38 to BGE.S $38) the program will then work in ST high res.

You're really stretching credibility with some of your examples,
Frogger particularly.

I recently purchased CAB 2.6 from ASH and was working on my own
private English RSC file. I have an older German version of Interface
I was using, and find it pretty simple. I did however have one
problem. It seems that Interface saves "to" an RSC, adding files
with the end of each edit session unless you save the RSC under a
different name. Is this normal, or is there something in the pref file
that I am missing? I didn't notice this just editing the menus, but it
was when I copied them from another RSC this occured.

TIA,

Mike

I am working on a project in GFA using Face Value.
I need to open several userwindows of toolstrip type. The toolstrip contains a radiopopup. As all windows share the same toolstrip tree I only get one radiopop_var&.

When the user makes a selection in the radiopopup I copy the radiopop_var& to the window array. When the "main" window area needs to be redrawn it's easy to know the radiopopup selection by just checking the window array.

For the radiopopup itself to be redrawn with correct selection I need to copy back the actual setting to radiopop_var& before Face Value's internal redraw mechanism starts. Is this possible to do at all in a clean way. If not, any comments on which procedure to hack into?

Dunno if such a thing exists (maybe given to official registered developers) - I have never seen it. However, both Modern Atari System Software, and the Atari Compendium (and I guess the Profibuch) document the SpeedoGDOS extensions.

> Is it kept online somewhere? It'd be kinda nice
> to use all those neat fonts when outputting.

Well, you can use a vector font in the same way as any other GDOS font,
although there are extensions.

The NVDI 4.1 Programmers guide gives details of the "Speedo" calls.
This is available online (in English and German) from ASH's pages, IIRC.

try just: fprintf(stdprn, "test\n");

stdprn is automatically opened on startup, and is defined in <stdio.h>

> But now I'm trying to learn C on my PC. The above command won't work.
> One old C book suggests using a constant of "prn" and another shows the

Use the stdprn file-handle - this is part of the standard C libraries, and
should be available everywhere.

Vst_load_fonts returns the number of loaded fonts in intout. Therefor
you should always use this call prior to the use of any font (except
the system font). Only in this way you are sure it will work with
gdos/fontgdos/speedo/nvdi etc.

This means that you should use this call even if you can use other
fonts without the call (nvdi vector fonts).

Well it does make sence even in multitasking. If you use fonts
without loading them first the vdi may unload them if the app that
loaded them before your app calls vst_unload_fonts. And if you are
using any loaded bitmap font your app wil run into trouble there the
font is not longer there.

So the function of Vst_load_fonts is more than only loading fonts. It
also keeps track of witch workstations use them.

Huh? If a game has x and y movement, it is two dimensional.

A vector used to describe the velocity of the "Pong" ball or "Combat"
bullet would need both x and y components.

You're turning simple math into something difficult.

Later,

Dan

Sounds ok, as long as vst_loadfonts can still be used to find out the number
of fonts available. (There is no other way AFAIK ?)

!!! TO ALL !!!
I need help!
I want to program my F030 (in assembly language). I had lot of
experience with the Atari XL/XE (6502), but the F030 is a little bit
harder.
I don`t know how to start. Therefore I need some litreture.
Further: what is the diffrence between 68000 and 68030.
         how about coding the DSP?
I hope you can help me!!!

No responses so far but I have come up with a solution myself:

If I put the following code at the beginning of @user_window_content() the
popup object gets redrawn with correct selection. This does change the clip
rectangle so I have to set the clip rectangle manually. Not a perfectly
clean solution perhaps but it does seem to work.

```
'
radiopop_var&=window_array&(index&,27)
@rsc_setup_tree(tolstrip&)
@rsc_ob_draw(index&,radiopop&)
'
@win_get_workarea(index&,wx&,wy&,ww&,wh&)

'Cos it's cool! :-))

>I *hate* it!

Naa! There's always a way round everything. Don't draw the icon if
magic is present - just make do with the text in the menubar.

To check for any version of magic is easy. Simply scan the cookie jar
for a cookie named 'MAGX' without the quotes.

Actually, it wouldn't surprise me if the other multitasking systems do
the same thing with the menubar (but I don't know) in which case you
might be better off interrogating the number of concurrent processes
and only enabling the icon if it is 1.

Even simpler is to have an option in the menubar to turn the feature
on and off. See lots of solutions! ;-))

GEM programs should _never_ output text directly to the screen, and .TOS programs should _not_ pause after doing text output. This is _very_ annoying for people who use a shell (these people use lots of .TOS and .TTP programs as well). If a program does want to pause, it should definately not circumvent the GEMDOS character input routines, coz' the program's input/output is often redirected into a pipe!
Pause should be handled by whichever program runs the .TOS program, however, the standard desktop isn't that smart...

Maybe a good idea would be to check the extension of the program (in argv[0]) and if it is .tos or .ttp, pause after execution, but if there's no extension (ie. it's probably on a Minix FS) just quit without pause.
Or something like that... :)

: A compiled GEM program containing this
: function will be posted as "Two Bit Tutorial
: Number 1" (probably in the binaries group)
: soon. It will NOT need a resource (*.RSC)
: file for proper operation, so don't worry
: that it doesn't have one! (You can rename
: it PAUSE.TOS, if the lack of a resource
: file causes problems.)

Why would a GEM program want to do text output to the screen anyway?

Hi All,

I have Lattice C v5.52 full disk set and all manuals (originally from HiSoft) and Personal Pascal (originally from an ST Format cover disk, but I got the manual from Hisoft).

Prices (inc P+P in the UK):-

Lattice C ; 50 UK pounds

Personal Pascal ; 10 UK pounds

Contact me at my email address if interested.

g > Is A2 a typo for A3? Otherwise if PureC called an MWC
g > compiled function things could go bad as MWC preserves
g > D3-D7/A3-A7.

No, in fact the first thing all the GEMDOS etc. bindings do is push A2 onto the stack.

As for compatibility, Pure C has some compiler options to create more compatible code (pass parameters using the stack, use standard stack frames, create DRI object code, etc). I'm not sure how they affect register usage, though.

g > Hmm, I can't think of any advantage to the contents being
g > volatile - the reverse actually! Have you got one in mind? I
g > must admit to a posessing a distinct aversion to the volatile
g > keyword so make it a good one! <G>

```
struct {
    unsigned char len;
```

```
    char str[255];
 } pascal;

    pascal.len = 4;
    pascal.str[-1] = 3;
    if(pascal.len != (unsigned) pascal.str[-1]) abort();
```

This is not a case of array overflow, since pascal.len is supposed to be equivalent to pascal.str[-1]. That's part of the whole point of using data structures.

Now it may be possible to make a compiler smart enough to handle the above using registers, but a clever enough programmer is bound to find something the compiler can't handle correctly (e.g. Lattice C).

> Any help is appreciated..Thanks.

Odd,

I don't program in assembler but here is the code that I use when
editing lines of speedo text in C:

```
if (speedo)
{
     vqt_advance32(handle,char,&advx,&advy);
     exactx+=advx;
     x=(exactx+32768)>>16;
   v_ftext(handle,x,y,rstring);
}
```

exactx is used to keep track of the x coordinate value in fix31. X
is the actual coordinate to use to display a character on the screen.
This works fine for me in placing a cursor correctly anywhere within
a line of text displayed with v_ftext().

There are two possible reasons why the width would be close but not quite right. One is you are not maintaining a continuous update of the fix 31 exactx (my assembler is too poor to tell from your code). Make sure you never calculate from the normal word value of x. Only use that to place your cursor or draw a character.

The other is that you may be noticing that speedo does not scale at the resolution documented for the atari screen. In other words, why do you say that the width is close but not correct -- what are you comparing it too that tells you it is not correct?

That may not make any sense unless you have tried to print out your text on the screen in relation to other vdi drawing primitives. When doing so, the programmer must scale the drawing primitives based on the relationship between the screen resolution and the printing resolution. The atari mono screen is documented in various places as 90 dpi or 91 dpi. You would expect to use a 300/90 ratio to get your drawing primitives the correct size on a 300 dpi printer. You do not have the opportunity to set the scale for speedo however; it handles that for you. If you use the 300/90 ratio, you will notice that speedo text is not the correct size in relationship to vdi primitives on the printed page. For some reason speedo uses the ratio 300/91.5 when it scales. This is a pain in the rear when trying to maintain the proper relationship between text and graphics in a printout.

Possibly! ;)

Project X (I think it is also called Merlin) is a new game system designed by VM Labs. Many former Atari people worked on the design, including one or two of the engineers who designed the Jaguar and Midsummer machines, and programmer Jeff Minter (Tempest 2000, Llamatron, Defender 2000, and so on.) And Bill Rehbock, another former Atarian, left his position at Sony to head up the recruitment of third party developers for Project X.

The marketing model sounds similair to the 3DO - multiple manufacturers sign a license to build hardware. There are supposedly several "Sony sized" manufacturers already signed on, but the only one known at this time is Phillips. They have said we will learn a lot more at E3.

It is the clear Atari connection to the hardware's designers that makes many people feel like this console will be the unofficial heir to the Atari legacy. In fact there was a rumor that Phillips was seeking to license the Atari name from JTS for their model of the Project X console. So while their is no concrete connection between Project X and Hasbro's purchase, many of us hope that there will bo one eventually.

I've think you've got the right idea. Stealth PR is not a bad idea. Besides, I think we can all safely say that Atari's public enemy #1 is the press. Judging from the Jaguar press that was received, "Jag is not 64-bits" "Jag is 16-bit" "Jag uses two 32-bit processors in tandem" yadda yadda yadda. Basically I think the Atari name needs to stay out of gaming magazines since most of the writers for these magazines are idiots.

Basically, good private PR and a big CES showing would be the prescribed medicine.

Geoff!

I wouldn't get my hopes up for any more Atari Computers period. After all, Atari computers division lost all of their computer development team (that's the ST/TT and Falcon crowd), they'd either have to track down the old people (which have jobs elsewhere) or get new people (which would require training/learning time).

I think it far more likely that we'll see Atari games for the PC or other platforms, and possibly a re-release of the Lynx or something of the sort.

Geoff!

That is an all-too-common theme of many of these messages, but lets be realistic here. Granted, the Tramiels marketing blunders obviously doomed TOS to eventual failure in the marketplace, but without the Tramiels, Atari would have been dead and burried in 1983 after Warner Communications ran the company into the ground. Without the Tramiels, there would have been _NO_ Atari 130XE, 520ST, 1040ST, Portfolio, STe, MegaST, SLM804, MegaSTe, SLM605, TT030, Falcon, Lynx, Jaguar, etc.

As frustrating as all the Tramiel's marketing blunders obviously are to us diehard Atarians, keep in mind that without them, we wouldn't even have had any of these incredible systems. Because of these systems, we Atarians were able to enjoy user-friendly operating systems and software a full decade ahead of the rest of the personal computer industry, and a reliable, frustration-free operating system that is still unequalled even by today's most current systems.

it's called during decompression but still i don't know
exactly when, i didn't try ...

>
> : JPGDComp1GammaPtr RS.L 1 * Component 1 Gamma Table / NULL
>
> What is the format for these tables?

usually gamma tables are 256 bytes arrays that
remap the 256 levels of each component into 256
other values, which is faster than calculating gamma
ratio each time...when the pointer is Null they're
just mapped to themselves....
this allows setting not only gamma effect
but light and contrast also....
you can simulate light/contrast by using
a simple function y=ax+b with "y" being
the gamma table entry "a" is the 'contrast'
and "b" the 'light' and x the index between
0 and 255.....in this case normal 'contrast'
must be 1.00 and normal 'lightness' 0.00
however this is a 'coarse' method but it
is also extremely fast :-)

Its the mystery video game system from VM Labs. It is rumored to be
more powerful than Sega's Katana and may use a DVD but other than that
details are few and far between.

Having just seen the above for the PC (MAME stands for Multiple Arcade Machine Emulator) , is there anyone out there thinking of compiling this for the Atari?

The source IS available...

That simply isn't true. The Atari ST was a cheap design. It was designed too quickly with no real innovation (try to think about the Sinclair QL, which was almost the same design and was produced 2 years before, or about the Amiga which was first introduced as a prototype a whole year before the ST).

The Tramiel management was very chaotic. They failed in marketing the computers. They also failed in designing them (come on, the Mega STs were more or less multi-megabyte memory STs in a new box, no magic here). They had this poor policy of making announcements about new designs years before actually producing them (or even not producing them).

Also, the Lynx was not created by them. It was bought from Epyx.

Granted, without the Tramiels, Atari's story would have been very different : we don't know who would have bought it back from Warner. But the Tramiels leading Atari was a total failure.

Now that's a _really_ strange thing to do!

The only reasonable way is to do what every normal C compiler does:
Let the called function make sure that it doesn't modify any registers
that the caller might want to keep. Normally there are a few scratch
registers (say d0-d2/a0-a1) that are free to destroy, though.

The reason it's done this way is of course that the caller has no way of
knowing what registers the called function is going to need.

>I read somewhere that modern compilers tend to ignore all the
>programmer's register variable declarations because, as you said, they

Yes, any modern compiler should do that.

You'll find GCC and Lattice code below.

```
>>int main(void)
>>{
>>  register int i,j,jj,ii;
```

```
>>  register int a[8][8],b[8][8]; /* whatever */
>>  jj=8;
>>  ii=8;
>>  for (j = 0; j < jj; j += 1)
>>  {

>>   {
>>     a[i][j] = b[i][j];
>>     foo();
>>    }
>>  }
>>  return 0;
>>}
>>
```

```
>>; a[i][j] = b[i][j];
>>.loop1:
>>     move.w  d6,d0
>>     lsl.w   #4,d0
>>     move.w  d5,d1
>>     add.w   d1,d1
>>     add.w   d1,d0
>>     move.w  d6,d2
>>     lsl.w   #4,d2
>>     add.w   d1,d2           ; surprising, it still knows
>
```

>Yes, quite clever to remember that.

Clever?
Well, I guess it's more optimization than PureC normally does...

I would never consider using a compiler that didn't see something that
obvious.

>Hmm. Good job I ran it through Mwc. It won't let me bind any sort of
>array definition to a register - only references, thus I had to modify

According to Lattice it's an error and GCC warns about it.
I wonder what the C standard has to say about this.

>... so Mwc hasn't got the brains to use spare registers to hold the
>base addresses for a and b. This tallies with what I meant below. I

It's kind of interesting that neither Lattice nor GCC does it either.
See below.

>haven't posted the Mwc assembly code 'cos it's not comparing like with
>like any more. :-(

If Mwc is as bad as you seem to describe, you really should get GCC.

This is what Lattice C produces with 32 bit integers and the best

possible (I think) optimization settings.
Lattice normally hates 16 bit integers, but in this case the code
is actually pretty similar.

```
       | 0000  4e75                          rts
```

This is that dummy function.

```
       | 0002  4e56 fdf8                      link      a6,#$fdf8
       | 0006  48e7 0300                      movem.l   d6-d7,-(a7)
       | 000a  7e00                           moveq     #$00,d7
       | 000c  6026                           bra.b     $0034
       | 000e  7c00                           moveq     #$00,d6
       | 0010  6018                           bra.b     $002a
```

Function and loop startup code.

```
       | 0012  41ee fdf8                      lea       $fdf8(a6),a0
       | 0016  d1c6                           adda.l    d6,a0
       | 0018  d1c7                           adda.l    d7,a0
       | 001a  43ee fef8                      lea       $fef8(a6),a1
```

If the arrays are sent as parameters Lattice will put their addresses
in registers, but apparently not otherwise.

Lattice claims it's an _error_ to declare local arrays 'register',
complaining about taking addresses of things that don't have any.

```
       | 001e  d3c6                           adda.l    d6,a1
       | 0020  d3c7                           adda.l    d7,a1
```

No calculations needed.

```
       | 0022  2290                           move.l    (a0),(a1)
```

Strange that no indexed addressing mode is used.

```
       | 0024  61da                           bsr.b     $0000
```

Nothing strange here.

```
       | 0026  7020                           moveq     #$20,d0
       | 0028  dc80                           add.l     d0,d6
       | 002a  0c86 0000 0100                 cmpi.l    #$00000100,d6
       | 0030  6de0                           blt.b     $0012
       | 0032  5887                           addq.l    #4,d7
       | 0034  7020                           moveq     #$20,d0
       | 0036  be80                           cmp.l     d0,d7
       | 0038  6dd4                           blt.b     $000e
```

Lattice C is very fond of strength reduction (that's what this kind of
optimization is called).

```
       | 003a  7000                          moveq     #$00,d0
       | 003c  4cdf 00c0                     movem.l   (a7)+,d6-d7
       | 0040  4e5e                          unlk      a6
       | 0042  4e75                          rts
```

This is what GCC (2.5.8) did when using 32 bit integers.
In my experience GCC usually does relatively well with 16 bit integers as well, but in this case it was about as bad as PureC for some reason.

```
.globl _foo
_foo:
     rts
```

Nothing much to say there.

```
.globl _main
_main:
     addw #-516,sp
     moveml #0x3e20,sp@-
     jbsr ___main
```

Well, the example function was called 'main' and some compilers do strange things with that special function.

```
     moveq #8,d6
     movel d6,d5
     moveq #0,d4
L10:
     moveq #0,d2
     cmpl d2,d5
     jle L5

     movel d4,d3
     asll #2,d3
     lea sp@(536),a2
```

This is of course only needed once per 'j'-loop.
Strange that it doesn't point a2 directly at one of the arrays, though.

```
L9:
     lea a2@(-256),a1
     lea a2@(-512),a0
     movel a0@(d3:l),a1@(d3:l)
```

If the arrays are made smaller, gcc will get rid of the LEAs and incorporate the constants into the MOVE.

GCC doesn't give an error if the arrays are declared 'register', but it does warn about it.

If the arrays are parameters to the function, there will be nothing

but the MOVE and only another ADDW will be added below!

```
     jbsr _foo
```

Nothing strange here.
With another version of 68k-gcc I tried, I actually managed to get rid of this call completely. The compiler tried to inline the function and discovered that it did nothing.

```
     addw #32,a2
```

Good idea!

```
     addql #1,d2
     cmpl d2,d5
     jgt L9
L5:
     addql #1,d4
     cmpl d4,d6
     jgt L10
     moveq #0,d0
     moveml sp@+,#0x47c
     addw #516,sp
     rts
```

As for the Lynx and the Portfolio they were both developed from other
companies. Everything the Tramiels did, was to buy the rights and to
sell them under the ATARI brand name. There were no improvements done by
ATARI.
So if the Tramiels hadn't bought the systems other companies would have
done this.

Tschuess,
Frank

Hi, and thanks for the help. I suddenly found out why my calculations didn't work, right after posting for help :) Boy, how stupid one can get sometimes... What I did was that I created a table of advance offsets that was already rounded! This is wrong, as this introduces lots of errors. Now, I just keep the advance vectors in this table as fix31 values, and don't to the rouding until all characters to print have been added. This is the correct way :)

Hasbro bought Tiger because of their excellent position in children's electronics. Tiger makes tons of handheld games, including all of the game show units (Wheel, Family Feud, Jeopardy!, etc.), Giga Pets, and the children's educational "computers" (they are the only real competition to V-Tech). Hasbro is trying to keep up with Mattel in the toy industry; both are running around buying up all of the smaller toy companies that complement the businesses that they already own. Tiger was attractive to them because they really don't have anything in the

way of handheld electronics or kid's computers. They also got ahold of the game show licenses, which their other divisions can use, like Parker Brothers, Milton Bradley, and CAP Toys (candy - you've probably seen the Connect Four and Monopoly candy...expect more!)

Tiger was also bought by Hasbro, Inc., while Atari was purchased by Hasbro Interactive. This may mean nothing, but it may signal that Tiger is considered more of a toy company to Hasbro, while Atari is considered more of a software company. I personally would expect HI to use the software licenses first, making new versions of the titles that they now own, then maybe look at the videogame market to see if it is a viable market for them. They don't own facilities to make something as large as a CD console system and would not be able to make one as cheaply as someone like Philips, but they might license the Atari name. The portable market is about to change a bit with the new Nintendo color portable, so if they're smart, they will wait and see what happens there. Just my $0.02 (still $0.02 with tax!!)

Subject: fVDI v0.84 released (with driver source)
Date: 1998/03/16
Message-ID: <6ekcu5hmc1@nyheter.chalmers.se>#1/1
X-Deja-AN: 334700976
Organization: Chalmers Computer Society, Gothenburg, Sweden
Newsgroups: comp.sys.atari.programmer

I don't know if any of you read on c.s.a.s two weeks ago (or in the

short note in one of the threads here) about the first fVDI release.
Only two people (out of the sixty or so who fetched it) have been in
touch with me about it and they both had Falcons. I'd _really_ like
to know how the monochrome driver works on STs and TTs.

Anyway, I've just released a second version, v0.84, and this time I hope
to get a few programmers interested since the complete sources for the
new 15/16 bit driver are included (and it's now possible to write most
of the drivers in C). Naturally, the rest of the sources can be had as
well if you're serious about helping me with this project.

As for fVDI v0.80, v0.84 should work in any Atari monochrome or four
plane (16 colours) graphics mode and now Falcon true colour is also
supported. The monochrome driver from v0.80 apparently worked well with
the NOVA cards and there's no reason why the same shouldn't be true
with this release. There are, however, now also two variations of the
15/16 bit driver that will hopefully also work fine on the NOVA. A beta
version had some trouble with the colours, which I think I've corrected.
(Does anyone happen to know how the various graphics cards deal with
16 and 24/32 bit colour?)

The monochrome driver accelerates everything that fVDI currently
supports (line, fill, mono-expand (vrt_cpyfm), fill and blit) while
the 4 bit driver only accelerates lines and the true colour driver only
fills. This means that the colour drivers will do almost everything
pixel by pixel, which of course is _very_ slow.

This is of course still far from a complete VDI implementation, but
quite a lot of software seems to work fine as it is.
Please, let me know of any problems you run into if you test it.

I'd expect performance (in monochrome) to be somewhere between Atari's
VDI and NVDI on most machines. Later versions will improve on this (the
goal is to be at least as fast as NVDI), especially in the text drawing
area (lots of overhead per character with the current implementation).
Since I can only test fVDI on my Falcon+AB040, I'd be very interested
in hearing how it performs on other hardware.

To download fVDI (or just to read more about it), go to my WWW pages.

By the way, I compiled FreeType (a free TrueType rendering library) for
TOS this weekend (that is of course going into fVDI in the future ;-).
If anyone wants to try it out, let me know.
I won't make any files generally available until I have GEM and greyscale
output working, and I don't have the time to work on that right now.
Perhaps someone else does?

I don't know if I'd classify the ST as a "cheap" design. After all, some prominent computer experts, including Dr. Jerry Pournelle, liked the ST more than the Amiga. However, it may be true that it was put to market too early. Early models didn't include the BliTTER, for example...

I suspect that what happened with the ST is that since Amiga was slipped out from under Atari by Commodore, they wanted to have a product to compete, and wanted to get to the market at or before the Amiga made it so that they would have a fighting chance.

It's already started in PC's, where the advice "buy as much machine as
you can, to avoid obsolescence as long as you can" has been replaced by
"buy as cheap as you can since the most expensive system will be
obsolete next week anyway." Accordingly, the $1000 and under PC's have

taken off by some estimates to equal up to %70 of sales. The only problem with seeing this extend to game consoles is that their $150 to $200 cost doesn't carry the sticker shock of PCs' considerably higher price tags, making a cheaper "oldie" console (a Super Nintendo, for instance) not that attractive to gamers demanding the latest.

That is EXACTLY what they will do. Anyone notice the popularity of the rerelease of Frogger for Playstation and PC? Hasbro is going to revamp and rerelease some of the old Atari games like Missile Command in similar fashion. I wouldn't expect to see a new atari-branded console from them, though. Read more in today's Wall Street Journal, by the way. Good story about the deal that even mentions retrogaming's current popularity (it talks a little bit about the MAME arcade emulator in there).

Nor a floppy disk drive :-)
Let me clarify my statement about "cheap" design. The ST family of home
computers was not revolutionary: basically it was just a 68k computer
running a modified version of Digital Research OS. The software was not new.
The concept was not new either (Apple Lisa and Macintosh were the first
commercial implementation). The hardware was not new (Motorola 16/32 bits
microprocessors were first introduced in 1978 if I recall correctly). What
really made these computers interesting was the price. Thus, it was the
cheap design that made their commercial success.

At the time, Sinclair had been producing a multitasking (even if it was just
task switching, really) computer running a windowed environnement on a
Motorola 68008 (8/16bits microprocessor). The machine had its share of
problems (mostly production) but it was more or less an ST-like, only
introduced years earlier. It was low-priced, too.

The Amiga had just been introduced. It was basically the same design as the

ST, only with the technical edge given by the specialized ASICs and the true multitasking environnement. (Jack Tramiel's) Atari had forked $1 million (or was it 10?) to help it's development. Commodore offered more money than Atari (by an order of magnitude) to buy the design. This other Atari failure forced them to create the ST.

> I suspect that what happened with the ST is that since Amiga was slipped
> out from under Atari by Commodore, they wanted to have a product to
> compete, and wanted to get to the market at or before the Amiga made it
> so that they would have a fighting chance.

Yes exactly. But Atari didn't ever catch up with the Amiga technology. It had it's share of success (mostly due to the popular MIDI interface and cheaper price tag at the begining of the ST life), but the Amiga became slowly more popular after the Amiga 500 was introduced.

The point I'm trying to make is that, for the first two years, Atari sold a lot more STs than Commodore sold Amiga. They had the money to evolve the ST and to create radical new designs. They had the market advantage. They didn't use it to get the technological edge. They just created cheaper designs when they were in the position to revolutionize the computer industry.

Great! I will try to get some time to look at it, but currently I'm trying
to figure out how to change resolution on my Nova card....

Also, their defenitly is a bug in NovaVDI regarding offscreen bitmaps which
makes it useless, or there is a bug in CAB. So fVDI with full Mach64 support
would be just great. I guess it wont happen over a day though.

This planet has -- or rather had -- a problem, which was this: most of the people living on it were unhappy for pretty much of the time. Many solutions were suggested for this problem, but most of these were largely concerned with the movements of small green pieces of paper, which is odd because on the whole it wasn't the small green pieces of paper that were unhappy.

: That simply isn't true. The Atari ST was a cheap design. It was designed too
: quickly with no real innovation (try to think about the Sinclair QL, which
: was almost the same design and was produced 2 years before, or about the
: Amiga which was first introduced as a prototype a whole year before the ST).

Absolutely. The ST and TOS were designed, built/programmed within one year.
The guys from Atari just used a user-interface written by Digital Research
for the PC and wrote a kind of MS-DOS-emulator they called GEMDOS.
The Amiga for instance was far superiour both in hardware and in software
design. The Amiga OS was fully pre-emptive multitasking, had dynamically
loadable libs (or something like it), etc, etc. The hardware for graphics
and sound was also a lot better (DMA stereo sound, hardware sprites, fast
blitter, more colours...)
The main things that made the ST series still sort of a success were the
built-in MIDI ports, the ability to use a nice monochrome-monitor and maybe
the MS-DOS compatibility (diskwise)...

Lets see... The story is from, I believe, Video Games and Computer
Entertainment. When Atari came in, the Lynx was still nothing but a
bunch a hand wired boards connected to an Amiga. Nothing was done in
the way of prototypes, figuring out battery usage, nor where to get
color LCD screens. Atari originally was just helping Epyx out with the
idea it was going to be join project but once it appeared that the
project wasn't going fast enough, Atari bought the Lynx from Epyx out
right and finished the project.

From the snipped part of your post, it appears that you use GFA. If so,
you _can_ program for Magic, Falcon & any other TOS-compatible system.
You just need to conform to GEM standards and avoid certain commands in
GFA that, while being easy to use, will not work with many systems.

Bye,
Vegard Hofsoy

Amiga was a 16 bit equlivent to the 8 bit 800. Both designs involved
thework of Jay Minor, he pushed for a 16 bit design. Amiga development
stalled
because projections showed that the cost of completing the development
was too high and simply no one was willing to risk taking the plunge.
The Amiga wasn't "slipped out" from under Atari, it sat idle for a
significant
time. Jack Tramiel brought the design for the ST. with him from
Commodore
and that is what Atari developed. The Amiga company was later acquired
by Commodore and development was completed. Initially Commodore withheld

information about the operating system to insure their ability to
maintain
control over the computer, but this had the undesirable effect of
slowing
sales due to the small software base.

The Tramiel philosophy was "Power without the price" Tramiel wanted to
bea business success not lead the technological front. Again he said
"Business is war!" I don't necessarily agree with this philosophy but
that is how
Atari was handled.

About a year ago, I got a version of MAME working on the TT, but it was
too slow to be playable. I even went so far as to write my own
direct-to-screen routines, but I was only able to get it to draw 10 frames
per second, at most.

Hi Johan

I compiled FreeType too, with Pure C. Did you have any problems? I get a
divide by zero error at Div64by32 function. I think that the code is not 100%
sizeof int independent.

Needless to say I have defined SIZEOF_INT 2 at ft_conf.h

Panayiotis Andriopoulos (yes, the JPEGD one ;-)

You don't say which machine but I think it very unlikely it is a
virus. The number of bombs will give you a clue. If you get 2 or 4 (or
2+4) it is likely that the store system is faulty. This is usually
caused by chips becoming insecure in the chip carriers.

To fix this properly you need to access the PCB and reseat all
socketed chips.

Just for thought, has anyone ever considered calling a 2D game 3D
because it is playing from a Picture Tube which in itself is 3D? That
would be funny, by that definition, all side scrollers would now be
considered 3D games.

I put it on disk (I use a PC for the net) and when I tried to unzip it
using STZIP it said it was a currupt/not a zip file.

Anyone else got this problem?

Some games have already been revamped. It certainly would take some
serious thought for me to go out and by another revamp of Missle
Command after Missle Command 3D unless it was a masterpiece of some
type.

I don't mean to be annoying, but doesn't the description:

"1-dimensional games that only last 3 minutes"

apply to just about any console game? In general, I have always preferred
computer games to console fighting, platform, and other low depth genre's.
With games like AvP, the Jaguar had the potential to bring more
computerish titles to the console market, but they instead dropped that
sort of development in favor of SNES style titles.

Very true, but a lot of programs do it anyway --
usually during an initialization failure. The
original request for a TSR program that would
stop the computer AFTER a program exit and BEFORE
the desktop was redisplayed was finally satisfied
with TOSX (Atari GEMINI CD).

> and .TOS programs should _not_ pause after doing
> text output.

If they print to the screen as they exit, the text
is cleared so quickly that it cannot be read. The
pause is important!

I'm trying to do some 3D stuff, and I'm wondering about projection.

Imagine I've 3D cordinates (X,Y,Z).
After rotations, I obtain (X',Y',Z')

What is the fastest method (no need of code, I'm talking about method) for projecting (X' Y' Z') for having 2D coordinates (Xp,Yp). ???

I'm using something like:

zoom=a+b/z

xp=cx+zoom*X'
yp=cy+zoom*Y'

where a and b are constants that defines the projection plane/depth and cx,cy are the coordinates of the centre of the screen.

Is it possible to do that without multiplications and/or divistion, even if it reduces the precision ? Perhaps by using tables ? But I'm a little bit short in memory, so it must be as little as possible.

Thank in advance,
Mike.

Yes, this is possible but there is a limit to how much customisation
can be performed before the Mwc editor refuses to change it back to a
menu. This is not to say the form won't work as a menu or course but I
guess the chances are it won't.

(speculation)
10. Hasbro wants to sue somebody because they are copyright
freaks. (Nobody interested in Atari has any money, so
they can't get any money.)
Comment on sale of Atari to Hasbro.
From my point of view, it means that a large, active (in
Atari) corporation now owns the rights to all Atari
copyrights.
Being a bit paranoid, I'd suggest that any sites carrying
Pac-Man, Star Raiders, or any other Atari held product
should think about what Hasbro might want to do with those
products, ie. be careful about having Atari products up for
download. They may justifiably say such activities interfere
with their ability to make a profit, even if the activities
are without profit motive.

Guys,

In all seriousness, the Jaguar is DEAD, it will not be revived, there wont be a Jag II, forget any hopes on that, there is a possibility (slim) for the Lynx though. If there will be a console system it will be a Project X console or this rumor of a 68040 console, but guys get it through your heads, Jag is DEAD. I love my Jag but its DEAD. Look for Retro PC Atari titles and titles for other systems, and hope for a Project X licensing with Atari on the case and Atari Retro Project X software, THAT is the only reality here.

We all love the Jag, but it is DEAD, get used to it, no Jag in the future.

Perhaps the Atari 26000 ??? Maybe.

Curt

I doubt it. After all, why pay $5 million for all of the rights just to
avoid licensing one of Atari's patents? Nintendo, Sega, and Sony are always
bumping into one or more of Atari's patents every day, yet this doesn't
bother them one bit.

>2) Hasbro is only interested in the game franchises so that they can make

I apologize if this sounds rude, as I don't intend it that way.

What amounts to the changing of hands of Atari ownership, IMHO, is pretty darn relevant to any Atari-related newsgroup. I would imagine that most Atari fans were elated at the news. Even though I don't know what plans Hasbro has for their newly acquired Atari properties (which, BTW, does include the ST line), I'd bet my bottom dollar that it's a whole hell of a lot more than what JTS has done.

I don't blame anyone one bit for crossposting. To an Atari aficionado, this is front page news; it deserves to be seen by anyone who shares even a remote interest in anything to do with Atari.

Wow... A once million dollar business, Atari has been sold for a mere
$5,000 US... the once powerful dominator of the 80s video game industry
has been reduced to $5,000... Do you know what Hasbro plans for the Atari
Fuji symbol et al?

Um, a lot of video games there days are costing $3 million, so $5 mil
for an entie library of assets, patents, titles and a name is chicken
feed.

The Lynx is probably one of the primary reasons for the purchase. It's not really outdated when you compare it to the LameBoy.

You all might want to check out Jaguar Interactive II. There's someone there (who I believe is from Hasbro) posting much information on this deal. The Lynx is definitely part of it too...

For $5000, one of us would have bought it ;-)

You forgot to add a few zero's to that figure. The Atari name definately
has some worth left in it. Hopefully with the renewed interest in
classic
gaming, Hasbro will capitalize on this. We'll see what happens though...

Actually, the management at Hasbro has been
amazed at the tenacity and loyalty of Atari
owners and figures they could add to their
core customer base of reliable shoppers that
will stick with them through thick and thin.

I've found a bit more information on customizing
menu bar entries in the Mark Williams Resource
Compiler documentation. Apparently, you can
dynamically change a defined menu bar into a form
and back again.

After changing it to a form, the strings can be
changed to icons. When done, just change it back
to an icon. Perhaps I'll dig my 520ST out of
storage and give it a try.

As it is I have just read it...
Anthony, if some jerk gets their kicks from someone who has contributed to the
Atari scene, then what can their opinion worth? maybe they just had a bad day?
But I would not like to see you go, and I think that I would benefit from any
coding you may be interested in doing.
You've already done a lot vis-a-vis your extensions for STOS.
About the question of feedback, that's a tough one.
-bug reports
When a program goes wrong on me I usually don't know what is _really_ at
fault. order of programs in auto folder? order of acc's? badly written software
(acc, or auto prg, or previous prg that left some stuff in memory???)
I am _also_ very busy, and when something doesn't work, I often just move on
because I have got STuff to do!! The few times I have gotten down to actually look
at prgs that give me problems, it takes a little time to figure out whats
running, what _exactly_ goes wrong, what messages are written, fortunately
Profile2.2 allows me to easily give a snapshot of my system.
-praise
not often enuf really. I remember sending a thank you to Tony Greenwood
on behalf of my nephews for HERO2! but it is not often I thank a programmer.
so thank you Anthony. regardless of whether or not you stay in the Atari
scene programming.
but I would like to see you continue programming for the Atari scene.

btw, isn't ZControl up to .24? :)

Think about it, guys. Didn't Project X's Jeff Minter state they had the backing of a MAJOR company at some point? Who's to say that major company wasn't HASBRO? If you think like I do, then I think you can start to see some sort of correlation here.

1) Project X is created by a bunch of former Atari Employees and aficiandos.

2) Project X becomes a rality, but is still secret, teasing us with the line: "We have the backing of a MAJOR corporation..." And, they're waiting for the right time to release it.

3) HASBRO buys Atari for $5,000,000. Hasbro is a huge company.

4) Hasbro now has the Atari name, products, trademarks, et al.

Theoretically, Hasbro could be that huge company Project X is signing onto, and they were working between Project X and JTS to get the name and the products so these former employees could use the Atari name on their new Project X. Granted, Atari isn't exactly an unsoiled name in the industry after the Tramiels got done with it, but if Hasbro and Project X can work this properly, I think it'd be a valid shot. This is also considering Hasbro would have the money to do an all-out advertising campaign, comparable to those of Sony and Nintendo. Enter the Lynx. The Lynx never had the following it could have had, and, being a color handheld with more power than any other, Hasbro has the library of games as well as the technology and advertising capability to really kick the Lynx's ass back into the ring. Also, third-party developers would be more inclined to develop for a well-advertised system, because it lowers the possibility of taking a loss on the venture. And...if Hasbro played their cards right, the Atari Jaguar could be resurrected as a 'low-cost gaming alternative' to the current array of systems. Open up the market for public-domain development materials on a larger-scale. It's a marketting idea for geeks, I know, but it'd reap rewards as being educational AND fun. And just think of all the developers that never gave the Jaguar a chance but could really get their name out on a larger scale if the Jaguar was indeed advertised and its games would get published on a regular basis? With a two-tiered philosophy (low-cost vs. premium) including Tiger Electronic's Game.com (low cost), Lynx (premium), Jaguar (low-cost), and the almighty Project X (premium), there's no doubt that they'd reap rewards off such a

deal. The right time is now, people.

If this is some sort of underlying conspiracy, let the conspiracy begin!

Atari is dead. It died when JTS merged with it. The question is, will
a new company called Atari, with the spirt of old, will come into
being. The worse thing that will happen is that the Atari name and
some old Atari games will come out in new updated software titles.
Hasbro isn't a stupid little company.

   *** TABS to 16 ***

 Hi, everybody. I'm in need for some help....again :) I'm trying to
use the vector/outline-fonts provided by NVDI, SpeedoGDOS and similar
system extensions. Now, my problem is that I don't know how to

calculate the advance vector for each font. Take a look at the small routine below, cause this is the code I use to set up a table with advance vectors (pixels). My problem is...do I calculate the pixel offset correctly? The Compendium tells me that to make an integer of the fix31 number returned by vqt_advance32() can be calculated like this;

```
 x_integer = (word) ([x_fix31] + 32768 >> 16 )
```

It nearly works, but not entirely...

```
;=== Build a width table from the currently set font ===
     ;D0 = VDI handle
     ;A1 = Pointer to a table to fill
mfntwtab  reg d0-a6
make_fnt_wtab movem.l  d0-a6,-(sp)

     cmp.l    #-2,gdos_v(a6)
     beq.s    .no_gdos
     moveq    #0,d1
     move.w   #255,d2

get_wtab  bsr  vqt_advance
     move.w   ptsout+8(a6),d3 ;Get fix31
     swap d3
     move.w   ptsout+10(a6),d3
     add.l    #32768,d3 ;Is this correct???
     swap d3  ;Get rounded integer
     move.b   d3,(a1)+  ;I hope a byte will do
     addq.w   #1,d1    ;Next ASCII
     dbra d2,.get_wtab
     bra.s    .exit

     ;This part work, as if this is executed, GDOS is not
     ;present, and the cell-width of the current character
     ;set is used.
no_gdos  bsr  vqt_attributes
     move.w   ptsout+4(a6),d3
     move.w   #255,d2
fill_wtab move.b   d3,(a1)+
     dbra d2,.fill_wtab

exit movem.l  (sp)+,d0-a6
     rts
```

This is the the steps I do to print a line;

1. Get character from string to print
2. Check if it is a control character (mark-start/mark-end, NULL,.)
   If it is, goto 6.
3. Get width of that character and add it (advance) to the width of the current line

4. Put the character into the intin array
5. goto 1.

6. If NULL, clear rest of line - exit
7. Clear the area these characters are gonna overwrite at X & Y (vr_recfl)
8. Print the characters in the intin array at X & Y.
9. Switch vdi handle (either normal or inverted display)
10. Add width of printed characters to X
11. Clear the width-variable, then goto 1.

What's wrong, is that the width of the line is not entirely correct. I suspect it's got something to do with the code above. It's not VERY wrong, but still...it's wrong :) Seems to be some small errors in the calculations...Heeelp :)

I could use vqt_extent(), but that would make it hard and the code slow when finding the correct character under the mouse-pointer, updating cursor, and so on... so I would rather not...

Oh, and.. to use the advx, advy, xrem and yrem returned by the vqt_advance() call, the compendium says that the x/yrem values are reminder values as a modulus of 16384. Could someone please explain this to me in detail?? I tried this too, but couldn't make any sense out of it.

Any help is appreciated..Thanks.

The problem with everyone's speculations as to whether or not "Atari" can rise from the ashes is...public perception. I spent 13 years as a video game/computer software store manager. Up until a year and 1/2 ago. Problem is that right now the public, by and large, perceive the company called "Atari" (and they DON'T know the difference between Midway's Atari and Hasbro's Atari!) is for the most part a has-been company. An outfit that makes sucky products that are now being cleared out for $50 per console at a toy store chain. A company that used to be cool, but can no longer cut the mustard.

Obviously, NOT MY OPINION. But, realistically, the opinion of the vast majority of folks who spend $$$$$'s out there, and aren't "in the know". Mention Atari to anyone who owns a PSX or N64, and they start talking about the VCS they have in their attic. They would not dream that you could be talking about anything after that!

Obviously, for the name "ATARI" to become a powerhouse name once more, it will take more than a cook, killer console. It will take lots of well-done PR, probably in "stealth" mode (the public can't be aware that they're trying to have their hearts won back over to the name once more). Part of me thinks it will be much, MUCH easier to turn a new, different name into a powerhouse than it will be to

find a way to rehabilitate the public's opinion's of an outfit
called "Atari".

No, Hasbro will do much better pushing the trademarks of the GAMES
that have names that folks fondly remember: Centipede, Warlords,
Asteroids, etc. Even Yar's Revenge (which started life as a Star
Castle home version) is still held in high regard with many folks
going down memory lane. New versions or collections with these
have a much better chance of making back the 5 mill that Hasbro
spent, IMHO. Unless the public starts getting tired of the new
90's versions of old games. How far can that go, exactly?

DAVE

Don't tell me that Hasbro is going to reintroduce the Jag console in it
current technelogical form considering that the Playstation kicks it and now
is in it's last legs of the product life cycle.

What really gets me is they seem to have paid $5 million for $45 million
in Atari debt (and of course, the technology). They _really_ paid $50
million for the assets. They are obviously planning to do something real
with it, simply suing for patent and copyright infringement and selling
licensing won't generate that kind of revenue.

Secondly, I am puzzled by the omission of the TT in the hardware
listing. I gues they just hit on the biggies (though I would think there
are more TTs than Falcons), or is the TT an "ST".

I'm _still_ glad I sold the stock as soon as I came back up to
break-even. JTS isn't looking too healthy is it?

Dan

But Tim - was the 'product' not a roaring success - in my view these
fine products failed to attract a very large market share solely due
to the lack of 'marketing' - most people never even heard of 'Atari'
other than for the older games machines that were well promoted in
their time.

When the 'Trammels' got involved in their money laundering operation
(at least that's how it seemed) they made absolutely no attempt to
'market' the product - which - upgraded a bit for the times - could be
successfully marketed today.

Or am I reading it wrong ???

Well first they bought Tiger Electronics not Atari? Why would they buy
both unless they had something planned, would be too much a waste of

money. Game.com is not moving on shelves too well. Perhaps they want to
do something in the way of video games but need a largely remembered
name like Atari. Suing for patent and copyright infingement could get
you good money depending on who or what is involvled. If it is simply
Jon Doe's Video Game Inc infinged on the patent of a design of
something totally meaningless by todays standard, you wouldnt get much,
but if it was Nintendo, Sony or Sega you could fetch more (Atari did
once already on Sega) especially if it had to do with something in the
Playstation console itself that couldnt be changed they could claim
damages millions and maybe make quite a bit of money.

The only way they could make any money with Jaguar anymore would be to
get the Jag/Jag CD combo out at well under $100. That way they could
attract some 3rd party developers to the CD, but IMO it is too late in
the current generation to make enough that way, especially now that the

Saturn will be officially canned at the end of the month. Another problem is power, the Jaguar is supposedly more powerful than Saturn (the Jag CD supposedly allows optimum access to this power) but is still is not at the level of Playstation in 3D. It probably could turn out convincing 2D platformers and 2D fighters though. I think a Project X liscense would be a better bet for the Atari name.

I was just thinking, NOW might be a good time to contact Hasbro and request they release the sources of all TOS versions and of other TOS software produced by Atari.

FreeTOS sounds like a good idea to persue and it would allow any capable authors to upgrade TOS 2.06/3.06 with better AES, serial routines and other essential patches, in a collective group like what is happening with FreeMiNT.

True. But it's surprising how many of them
do not recognize a SHIFT or CONTROL keypress.
For best coverage, Bconis() and Bconin()
worked the best ... and that was the point.

Also -- a bit of research turned up a program
that does what the original poster requested:
TOSX is a terminate-and-stay-resident program
that senses when a program stops, and prevents
the desktop from appearing on-screen until the
user presses a key.

I found it on the Atari GEMini CD in
files\other\tosx

Good Luck.
Remember there are several contracts that still exist as license
agreements with other companies for the use of TOS.
Like Medusa Computersystem for TOS 3.06 or the soon to be released Milan
(Milan homepage at http://www.milan.atari.de).

I would imagine you would to sign an agreement with some cash up front
to get these sources of TOS.

I hope you can do it.

BTW, did you sell all of your Atari wares just recently.

Nah. Considering how desperate JTS is for cash, they could have gotten the license for said technology much cheaper.

>
> 2) Hasbro is only interested in the game franchises so that they can make

This sounds very likely. Regardless of what else Hasbro may do with the Atari properties, I am quite sure we'll see this.

>
> 3) Hasbro wants to enter the handheld game market and plans to rerelease
> the Lynx.

This also sounds possible to me. Purchasing Tiger shows they have an interest in the handheld market, and perhaps even gives them a plant or two to manufacture the Lynx in. Perhaps even the ability to fabricate their own LCD screens? Should bring down manufacturing costs considerably!

Wouldn't a faster, higher-resolution Lynx be cool? Woo-hoo! (Imagine a Lynx with a 320x200 screen, running at double the clock speed, with 3D support in hardware, and a built-in [or bundled] TV tuner, all for only $99. I like it!)

But man, I really hope they don't try to sell it as the Tiger Lynx! Yuck.

>
> 4) Hasbro wants to enter the home console market and plans to rerelease
> the Jaguar as a "budget" home video game console for around $50.

No way, they couldn't manufacture the Jaguar chep enough to really meet this price point. And the Jaguar's dated technology and poor reputation would really be unable to compete against the strong current market share of the PSX and N64. I love my Jaguar, but I'm afaid it is too dead for this.

>
> 5) Hasbro wants to enter the home console market and plans to release
> an upgraded Jaguar to compete against the N-64 and PS.

Well, the Jaguar II design (AKA Project Midsummer) was completed, and was supposedly quite powerful. I believe the hardware could compete if they came up with some good software for it. But I would sooner bet that Hasbro is a Project X licensee then say they intend to revive the Midsummer architecture.

>
> Fantasy: (In order of what I'd most wish for)

Any notion of Hasbro putting the Atari logo on a piece of hardware
pretty much goes hand-in-hand with this one!

>

Never happen. And personally, I'd rather see the Lynx come back. Though
it would be cool to see a 2600/7800 emulator for the Lynx. You could
easily cram a couple dozen games on a single Lynx cart, along with the
emu software. (Hey, it could happen - the Lynx does have a 6502-based
CPU, after all!)

It would be fun to see them try the home computer/game computer
concept again using an upgrade of one of the Atari platforms. I doubt
its going to happen. We'll probably just see software and if we do see
hardware it'll be something new.

>Well, not so smart. Why saving all registers? Are they completely
>free in MWC functions?
```

Sorry. I meant that it stacks all the stuff it has in register variables before calling a function except that it behaved itself for this example!! See below however.

Hmm. Good job I ran it through Mwc. It won't let me bind any sort of array definition to a register - only references, thus I had to modify the above slightly to ...

```
foo()
{
}

bob(a,b)
register int a[8][8],b[8][8];
{register int i,j,ii,jj;

 /* rest unchanged */
}
```

```
main()
{int a[8][8],b[8][8];

 bob(a,b);
}
```

... so Mwc hasn't got the brains to use spare registers to hold the base addresses for a and b. This tallies with what I meant below. I haven't posted the Mwc assembly code 'cos it's not comparing like with like any more. :-(

>
>Not AFAIK.

Well I had just assumed it was because Mwc was old and not too good on optimisation although I was thinking of the base address rather than the accesses to array contents when I asked the above (none too clearly). I'm amazed I forgot Mwc can't bind registers to arrays but then again I have forgotten even more fundamental things in the past. I picked a really lousy example from the Mwc point of view!

It should but I've just (re)discovered a bit of a problem with MWC - it doesn't let you bind an array definition to a register. It'll let you bind an array reference of course as this is simply a pointer, rather than an offset and a pointer which is required for the definition. Having said that, there is no reason why it could not use spare address registers when available but it doesn't.

>You get the exact same code in the above example with or without

Is A2 a typo for A3? Otherwise if PureC called an MWC compiled function things could go bad as MWC preserves D3-D7/A3-A7.

Ah. I thought you meant the base addresses (or pointers), not their
contents. Hmm, I can't think of any advantage to the contents being
volatile - the reverse actually! Have you got one in mind? I must
admit to a posessing a distinct aversion to the volatile keyword so
make it a good one! <G>

Aha. That makes things a bit clearer!!

>I'm curious though, would the 2 pixel per byte 4 bp mode register as
>a Non-atari bitplane mode? (when inquired from the VDI)

I have absolutely no idea. I consider the vdi to be what it's name
suggests, a virtual device. All I care about is the screen width and
height and how many colours it can display. The only time I've ever
enquired the number of bitplanes is when allocating memory to make
copies of the screen.

I would hope (and expect) the first 16 colours of a 256 colour display
to match the 16 colours used on a 16 colour display, just as the first
four of the 16 colour display match those of the 4 colour display,
which in turn match the monochrome disply iyswim. ;-)

>What resource file was that?

It was simply to animate a couple of icons to test some theories
people have been discussing about animation using the vdi. Not
important now as I just drew a red "sprite" with v_bar() because the
animation routines are (hopefully) resolution independant. The
bottleneck will obviously be on STF machines.

>I skipped large parts of this thread,

>though... :(

I know what you mean. It is bad enough getting behind but worse is you
can't remember what is going on and have to read and re-read stuff you
wouldn't have needed to otherwise (or bin it all and join in the new
threads).

Such is life! ;-|

Both should be fine as the end result is an ST screen. The screen
which you normally see when playing the game would not actually be
visible but STOS would not know that. Regular calls could be made to
copy/translate it to the current display by the host machine.

>> >>hard part would be for the Gem application to get at information it

Such as Setscrn() which could then be trapped by the host machine so
it could cleanly keep track of which screen STOS is currently using as
its visible screen.

>> >Couldn't you 'just' replace the switch call with a 'blit to GEM window'

These would have to be addressed of course.

Perhaps this can be solved by the host again - simply by having it
load the game high up in memory so that the lower remains unused?

>There are other issues that come into

>play when dealing with STOS...

No doubt. :-)

Basically the idea is to make it self contained. Visualise it as
getting to a point where STOS will run happily in its own little
cacoon without upsetting the host. If that is possible without making
so many changes as to affect ST games then figure out the i/o.

The VGA reate can be anything your monitor and video hardware can handle...
IIRC "standard" VGA is something like 65 Hz, it flickers like hell.
(You'd be surprised at how many PC owners leave their video settings
at standard VGA, while having hardware capable of at least 90 Hz!)
Standard SVGA might be the 73.xHz you mentioned, I don't know about that.
I myself use 78Hz on my Falcon...

Hello to all,

I was given an email earlier this morning from an individual who gave me a link for the Techstocks website, within the website it reference that JTS had filed an 8K form for the sale of assets, specifically Atari to Hasbro Interactive.

I decided the only way to know for sure if this was fact or fiction was to go to the source, since JTS is a publicly traded I went to the SEC site at www.sec.gov

So go to www.sec.gov, go to the Edgar Archives, select 8K and type in JTS for the ticker and Viola!!! You get for February 23, 1998 the sale of most Atari assests to
Hasbro for (GET THIS!!!) only $5,000,00!!!

Its real, its true and its official, Atari has been

sold!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

```

> I'm thinking of what PureC does with the register variables when it
> has to call foo()?

I didn't compile the stuff, but Pure C will allocate i and j in
D3 and D4, a and b will go into A2 and A3, and for each a[][]=b[][]
the whole adres calculation will be done in d0 and d1. As foo() will
only distroy D0-D2 and A0-A1 there is no need for saving registers.

Well, I did put it through PC:

```
void foo(void)
{
 (void) 0;/* whatever */
}

int main(void)
{
  register int i,j,jj,ii;
  register int a[8][8],b[8][8]; /* whatever */
  jj=8;
  ii=8;
  for (j = 0; j < jj; j += 1)
  {
   for (i = 0; i < ii; i += 1)
   {
     a[i][j] = b[i][j];
     foo();
    }
  }
  return 0;
}

; void foo(void)
foo:
     rts

; int main(void)
     movem.l d3-d6/a3,-(a7)
     lea.l   -$100(a7),a7
; jj=8
     moveq   #$08,d3
     move.w  d3,d4          ; this is ii=8
; for (j=0; j<jj; j+=1)
     clr.w   d5             ; j=0
     lea     $80(a7),a3
     bra.s   .label0
; for (i=0; i<ii; i+=1)
.loop0:
     clr.w   d6;            ; i=0
     bra.s   .label1
; a[i][j] = b[i][j];
.loop1:
     move.w  d6,d0
     lsl.w   #4,d0
     move.w  d5,d1
     add.w   d1,d1
     add.w   d1,d0
     move.w  d6,d2
     lsl.w   #4,d2
     add.w   d1,d2           ; surprising, it still knows
     move.w  (a7,d0.w),(a3,d2.w)
; foo();
     bsr     foo
```

```
; for (i=0; i<ii; i+=1)
     addq.w  #1,d6
label1:
     cmp.w   d6,d4
     bgt.s   .loop1
; for (j=0; j<jj; j+=1)
     addq.w  #1,d5
.label0:
     cmp.w   d5,d3
     bgt.s   .loop0
; return 0;
     clr.w   d0
     lea     $100(a7),a7
     movem.l (a7)+,d3-d6/a3
     rts
```

> Mwc promptly stacks all the stuff it has in registers at foo() then
> unstacks them when foo() returns, causing more overhead than if there
> were no register variables used in the first place.

Well, not so smart. Why saving all registers? Are they completely
free in MWC functions?

> I read somewhere that modern compilers tend to ignore all the
> programmer's register variable declarations because, as you said, they
> can do better.

Pure C does AFAIK.

> >Just remember that arrays,
> >structures and unions will always be treated as volatile.
>
> I take it that is part of the definition of C? I was aware that Mwc
> does this but never thought about it in its wider context.

Not AFAIK.

Bye, Hans

Heehe yea.. :-)

> Standard SVGA might be the 73.xHz you mentioned, I don't know about that.
> I myself use 78Hz on my Falcon...

I cannot for the life of me remember where I got it from, but I'm sure
I heard that figure somewhere :-)

Maybe its just my memory...

> : As Peter is fond of saying, there should be no problem doing this
> : on a 100Mhz 060.
>
> Can a 060 do 100Mhz?

I assume so, as thats what Peter keeps quoting (isn't it double-clocked 50Mhz?)

> : PLEASE READ THE UPDATE ON MY WWW PAGES, AND COMMENT...
>
> That desperate, eh?

You haven't read the update then, I take it.

I have been *seriously* questioning whether to stay with the Atari,
or to jump ship, and wanted to know peoples opinions on the subject...
I am still interested in comments, although I have 99% decided which
route to go...

Anthony

It depends what you mean by STOS... The original STOS graphics routines (line, box, that sort of thing) use line-a. All extensions, and I believe the original STOS sprite routines all write directly to screen memory.

I am not 100% certain on this, but I believe that it does it by directly accessing the physbase register (not sure though). Still, wouldn't be that hard to search through it and replace accesses to these regs with another (cleaner) routine...

> >Couldn't you 'just' replace the switch call with a 'blit to GEM window'
> >call?
>
> Hopefully!

Maybe, although I've found that STOS does some *very* strange things to GEM. Before something like this could actually be put into practice (for STOS) you would probably have to re-write a chunk of memory-management routines (it [wrongly] assumes it can use any RAM from the end of the executable to the end of RAM). There are other issues that come into play when dealing with STOS...

```
void foo(void) {return;}

main()
 {
 register int i,j;
 register long a[4][4],b[4][4];

 for (j = 0; j < 4; j += 1) {
  for (i = 0; i < 4; i += 1) {
   a[i][j] = b[i][j];
   foo();
   }
  }
 return(0);
 }
```

I've never defined a register array before, but I assume that what it does is assign an address register to the array address, rather than attempt to define a data register to every element.

You get the exact same code in the above example with or without using register variables. Removing the call to foo() only changes the use of A3 to A1 (Pure C requires that functions preserve A2-A7 and D3-D7).

However, I have found cases where adding register variables does

make a difference, so Pure C doesn't totally ignore the "register" keyword. It only comes into play when you start running out of registers.

> Just remember that arrays, structures and unions will always
> be treated as volatile.

g > I take it that is part of the definition of C? I was aware
g > that Mwc does this but never thought about it in its wider
g > context.

Beats the heck out of me. But since all have defined relationships between their components wrt their locations in RAM, one could get into big trouble if the value in RAM was not kept current. So the compiler might as well treat them as volatile and avoid possible bugs.

Item 2. Acquisition or Disposition of Assets.
- ---

On February 23, 1998, JTS Corporation (the "Company") sold substantially all of the assets of the Company's Atari Division, consisting primarily of Atari home computer games and the intellectual property rights and license agreements associated with such games (the "Atari Assets"), to HIACXI, Corp. ("HIAC"), a

wholly-owned subsidiary of Hasbro Interactive, Inc., for $5,000,000 in cash. The purchase price was determined based upon arm's-length negotiations between the Company and HIAC. The Atari Assets were acquired by the Company in July 1996 when the Company merged with Atari Corporation. There is no material relationship between HIAC and the Company, any of its affiliates, any director or officer of the Company, or any associate of any such director or officer.

Item 7. Financial Statements and Exhibits.

(a) Financial statements of business acquired.

Not applicable.

(b) Pro forma financial information.

Unaudited Pro Forma Condensed Combined Financial Statements of the Company.

(c) Exhibits

99.1 Asset Purchase Agreement, dated February 23, 1998, between the Company and HIAC.

SIGNATURES

Pursuant to the requirements of the Securities Exchange Act of 1934, JTS Corporation has duly caused this report to be signed on its behalf by the undersigned hereunto duly authorized.

JTS CORPORATION

Date: March 9, 1998

JTS CORPORATION AND
THE DISPOSITION OF THE ATARI DIVISION

UNAUDITED PRO FORMA CONDENSED FINANCIAL STATEMENTS

The following unaudited pro forma condensed financial statements give effect to the disposition of the Atari Division which was consummated on February 23, 1998. The accompanying pro forma condensed balance sheet as of November 2, 1997 assumes that the disposition of the Atari Division by the Company took place on November 2, 1997. The accompanying pro forma condensed statements of operations for the year ended February 2, 1997 and the nine months ended November 2, 1997 assumes that the disposition took place as of the beginning of the periods. The pro forma condensed statements of operations do not include the effect of any nonrecurring charges directly attributable to the disposition. The results are not necessarily indicative of what would have occurred had the disposition actually been made at the beginning of each of the respective periods presented or of future operations of the Company.

JTS CORPORATION AND
THE DISPOSITION OF THE ATARI DIVISION
NOTES TO UNAUDITED PRO FORMA CONDENSED FINANCIAL STATEMENTS

NOTE 1.

The disposition of the Atari Division assets was effective February 23, 1998. These pro forma condensed financial statements illustrate the impact on the nine months ended November 2, 1997 as if the disposition occurred on November 2, 1997 for the pro forma condensed balance sheet and as at February 2, 1997 for the pro forma condensed statement of operations.

NOTE 2. PRO FORMA ADJUSTMENTS

Certain pro forma adjustments have been made to the accompanying pro forma
condensed balance sheet and statement of operations as described below:

(a) Elimination of the revenue and expenses for the Atari Division.

(b) Reflects the profit on disposal of the Atari Assets.

ASSET PURCHASE AGREEMENT

THIS ASSET PURCHASE AGREEMENT (THIS "AGREEMENT") IS ENTERED INTO ON FEBRUARY 23, 1998, BY HIAC XI, CORP., A DELAWARE CORPORATION ("BUYER"), AND JTS
CORPORATION, A DELAWARE CORPORATION ("SELLER").

RECITALS

This Agreement contemplates a transaction in which Buyer shall purchase

certain assets (and assume certain future obligations) of Seller in return for the consideration described herein. Buyer is a wholly-owned subsidiary of Hasbro Interactive, Inc.

NOW, THEREFORE, the parties, intending to be legally bound, hereby agree as
follows:

I. CERTAIN DEFINITIONS. As used in this Agreement, the following terms have the meaning given to them below:

"Acquired Assets" means the following assets of Seller:

A. All right, title and interest in and to the Seller's Products;

A. All Intellectual Property associated with the Seller's Products,
including the Intellectual Property identified on SCHEDULE 1, and remedies past
and future against infringements thereof and rights to protection of interest therein;

A. The license agreements listed on SCHEDULE 2 (the "License Agreements");

(d) All of Seller's claims, causes of action, choses in action, rights of recovery, set-off and recoupment relating to or arising out of any right, property or asset included in the Acquired Assets; and

(e) all business and financial records, books, files, plans, documents, correspondence, lists, drawings, notebooks, specifications, creative
materials, advertising and promotional materials, marketing materials, studies and reports of Seller, whether written or electronically stored or otherwise recorded if, and only to the extent, that such foregoing items relate to the Acquired Assets (not including the items of this clause (e) for these purposes)
or Assumed Liabilities (subject to Section 5(b)).

Notwithstanding the foregoing, the Acquired Assets shall not include the Excluded Assets.

<PAGE>

"Assumed Liabilities" means only liabilities and obligations arising after the Closing under each License Agreement actually assigned to Buyer pursuant to this Agreement.

"Atari Hardware Platforms" means the following hardware platforms: Atari 2600, 5200, 7800, Lynx hand-held and Jaguar game system hardware, Atari 800, ST and Falcon 030 computer family hardware, TOS operating system, 8-bit operating system, and Portfolio palmtop computer.

"Excluded Assets" means the following assets:

(a) inventory, receivables, furniture, fixtures and equipment;

(b) any tax assets of Seller, including pre-paid taxes, tax credits and tax carryovers;

(c) all tax returns and tax records whether or not related to the Acquired Assets;

(d) the $45,000 balance of the royalty guarantee owed to Seller on December 31, 1997 by Interplay Productions, Inc. under Amendment One to the Game License Agreement dated July 29, 1996, between Atari Corporation and Interplay Productions, Inc. and as otherwise identified in SCHEDULE 3;

(e) software developed by or for Seller or its predecessor under license of intellectual property rights from a third party or third parties for use on the Atari Hardware Platforms to the extent that such software is not related to or associated with any of the trademarks and copyrights set forth in SCHEDULE 1 or any of the game titles set forth in SCHEDULE 3;

(f) Hardware embodying Intellectual Property (other than Seller's Intellectual Property) that is licensed from third Persons.

(g) all assets associated with or related to Seller's disk drive business.

"Hardware" means equipment, components, circuitry, integrated circuits, processors, casings, layouts (including synthesizable code), mask works, manufacturing data, and all designs, schematics, tooling, formulae, processes, and know how therefor (whether or not any such items are presently embodied in physical components) and related Intellectual Property.

"Intellectual Property" means any or all of the following and all statutory and/or common law rights throughout the world in, arising out of, or associated therewith: (i) all patents and applications therefor and all reissues, divisions, renewals, extensions, provisionals, continuations and continuations-in-part thereof; (ii) all inventions (whether patentable or not), invention disclosures and improvements, all trade

<PAGE>

secrets, proprietary information, know-how and technology; (iii) all works of authorship, "moral rights", copyrights (including derivative works thereof), mask works, copyright and mask work registrations and applications; (iv) all industrial designs and any registrations and applications therefor; (v) all trade names, logos, trademarks and service marks, trademark and service mark registrations and applications together with the good will of the business symbolized by the names and the marks; (vi) all computer software including

all
source code, object code, firmware, development tools, files, records and data,
all media on which any of the foregoing is recorded; (vii) Uniform Resource Locators, World Wide Web site addresses and domain names; (viii) any similar, corresponding or equivalent rights to any of the foregoing; (ix) all documentation related to any of the foregoing; and (x) all goodwill associated with any of the foregoing.

"Key Marks" means each of the following marks: Atari, the Fuji logo,
Asteroids, Battlezone, Breakout, Centipede, Combat, Crystal Castles, Millipede,
Missile Command, Night Driver, Pong, Ultra Pong, Tempest, Warlords and Yar's Revenge.

"Knowledge" means actual knowledge of (i) the senior executives of Seller or (ii) John Skruch.

"Lien" means any mortgage, pledge, lien, security interest, charge, claim, equity, encumbrance, restriction on transfer, conditional sale or other title retention device or arrangement (including a capital lease), transfer for
the purpose of subjection to the payment of any indebtedness, or restriction on
the creation of any of the foregoing, whether relating to any property or right
or the income or profits therefrom.

"Person" means an individual, a partnership, a corporation, an association, a joint stock company, a trust, a joint venture, an unincorporated
organization, or a governmental entity (or any department, agency, or political
subdivision thereof).

"Registered Intellectual Property" means all United States, international and foreign: (i) utility and design patents, design registrations
and utility models and all pending applications (both regular and provisional) for any of the foregoing; (ii) registered trademarks, service marks or trade names, applications to register trademarks, service marks or trade names, intent-to-use applications, or other registrations or applications related to trademarks, service marks or trade names; (iii) registered copyrights and applications for copyright registration; (iv) any mask work registrations and applications to register mask works; (v) Uniform Resource Locators, World Wide Web site addresses and domain names and (vi) any other Seller Intellectual Property that is the subject of an application, certificate, filing, registration or other document issued by, filed with, or recorded by, any state,
government or other public legal authority.

"Seller Hardware" means Hardware included in the Acquired Assets.

"Seller's Intellectual Property" means Intellectual Property of Seller that constitutes an Acquired Asset.

"Seller's Products" means (i) those products of Seller acquired by Seller pursuant to the merger of Atari Corporation, a Nevada corporation, with and into Seller on July 30, 1996, and any other products of Seller thereafter derived therefrom, including products relating to or associated with the trademarks set forth in SCHEDULE 1 (including video and computer games, games for handheld devices, consoles, Internet play, all other games for play on any platform whatsoever (subject to the License Agreements), and merchandise bearing any Intellectual Property relating to or associated with the foregoing, whether now offered for sale or license by Seller or discontinued) and (ii) all of Seller's products that are listed on SCHEDULE 3.

I. SALE AND PURCHASE; ASSUMPTION OF LIABILITIES; PURCHASE PRICE; CLOSING.

A. SALE AND PURCHASE OF THE ACQUIRED ASSETS. At the Closing (as defined below), on the terms and subject to the conditions of this Agreement, Seller shall sell and Buyer shall purchase all of the Acquired Assets for the sum of $5 million to be paid at the Closing by wire transfer to an account designated by Seller.

A. ASSUMPTION OF LIABILITIES. In addition, at the Closing, on the terms and subject to the conditions of this Agreement, Buyer agrees to assume and become responsible for all of the Assumed Liabilities at the Closing. Buyer shall not assume or have any responsibility, however, with respect to any other obligation or liability of Seller that is not an Assumed Liability. Without limiting the foregoing, Buyer shall not assume or be responsible for any liabilities relating to events arising or occurring prior to the Closing, regardless of when payable, and all such liabilities shall be for the account of Seller.

A. CLOSING; CLOSING DELIVERABLES. The closing shall occur in the offices of Wilson Sonsini Goodrich & Rosati, 650 Page Mill Road, Palo Alto, California 94304 upon the execution and delivery of this Agreement by the parties hereto ("Closing"). At the Closing the parties will deliver the following documents, and such additional documents as the parties may agree to transfer ownership of the Acquired Assets to Buyer (which shall be in form satisfactory to both parties) :

1. Seller shall deliver:

(A) A bill of sale for the Acquired Assets.

(B) Global trademark assignments.

(C) Country-specific trademark assignments.

<PAGE>

(D) Patent assignments in recordable form.

(E) Assignment of the License Agreements.

(F) Copyright assignment.

(G) Global powers of attorney respecting trademarks.

(H) Country-specific powers of attorney respecting trademarks.

(I) Assignment of Internet domain name.

(J) Disclosure Schedule (as defined below).

1. Buyer shall deliver:

(A) The purchase price by wire transfer.

(B) An instrument of assumption of the Assumed Liabilities.

A. ASSIGNMENT OF CONTRACTS AND RIGHTS. Anything in this Agreement to the contrary notwithstanding, neither this Agreement nor the consummation of the transactions contemplated hereby shall constitute an assignment, or an agreement to assign, any Acquired Asset or any claim or right or any benefit arising thereunder or resulting therefrom (a "Consent-Required Asset") if an attempted assignment of such Consent-Required Asset, without consent of one or more third parties, would constitute a breach or other contravention thereof or would in any way adversely affect the rights of Buyer or Seller thereunder; PROVIDED, HOWEVER, that once all such consents are obtained, this Agreement shall automatically effect an immediate assignment of such Consent-Required Asset without further action by either party hereto. Buyer and Seller will use their commercially reasonable efforts (which shall not be deemed to require any payment of money or other value by Seller or Buyer) to obtain the consent of the other parties to any such Consent-Required Asset for the assignment thereof to Buyer as Buyer may reasonably request. If such consent is not obtained, or if an attempted assignment thereof would be ineffective or would adversely affect the rights of Seller thereunder so that Buyer would not in fact receive all such rights, Seller and Buyer will cooperate in a mutually agreeable arrangement under which Buyer would obtain the benefits and assume the obligations

thereunder in accordance with this Agreement, including sub-contracting or sub-licensing to Buyer, or under which Seller would enforce for the benefit of Buyer, with Buyer assuming Seller's obligations, any and all rights of Seller against a third party thereto. Seller will promptly pay or assign to Buyer when received all monies received by Seller with respect to any Consent-Required Asset and any claim or right or any benefit arising thereunder, except to the extent the same

<PAGE>

represents an Excluded Asset. Nothing in this Section 2(d) shall be construed to diminish the representations, warranties and covenants of Seller respecting such consents.

I. REPRESENTATIONS AND WARRANTIES OF SELLER. Seller represents and warrants to Buyer that the statements contained in this Section 3 are correct and complete as of the Closing, except as set forth in the disclosure schedule separately delivered by Seller to Buyer with this Agreement, which schedule shall be initialed for identification by the parties (the "Disclosure Schedule"). Except as expressly set forth in this Agreement and the Disclosure Schedule, Seller hereby expressly disclaims any and all other warranties of any kind or nature, whether express, implied or statutory, relating to the Acquired Assets, including the implied warranties of title, non-infringement, merchantability and fitness for a particular purpose. Buyer acknowledges that the Seller Hardware is transferred "as is" and that, notwithstanding anything to the contrary in this Agreement and the Disclosure Schedule, Seller makes no representation or warranty of any kind with respect to the Seller Hardware.

A. ORGANIZATION OF SELLER. Seller is a corporation duly organized, validly existing, and in good standing under the laws of the State of Delaware.

A. AUTHORIZATION OF TRANSACTION. Seller has full corporate power and authority to execute and deliver this Agreement and to perform its obligations hereunder. Without limiting the generality of the foregoing, Seller has taken all corporate and other action required for the execution, delivery and performance of this Agreement by Seller, including the sale of the Acquired Assets as provided herein. This Agreement constitutes the valid and legally binding obligation of Seller, enforceable in accordance with its terms. The persons who have executed this Agreement on behalf of Seller have been duly authorized to do so.

A. NONCONTRAVENTION. Neither the execution and the delivery of this Agreement, nor the consummation of the transactions contemplated hereby, shall

(i) violate any statute, regulation, rule, judgment, order, decree, stipulation, injunction, charge, or other restriction of any government, governmental agency, or court to which Seller is subject or any provision of the charter or bylaws of Seller or (ii) conflict with, result in a breach of, constitute a default under, result in the acceleration of, create in any party the right to accelerate, terminate, modify, or cancel, or require a notice under any contract, lease, sublease, license, sublicense, franchise, permit, indenture, agreement or mortgage for borrowed money, instrument of indebtedness, security interest, or other arrangement to which Seller is a party or by which it is bound or to which any of its assets is subject, except where the violations, conflicts, breaches, defaults, accelerations, terminations, modifications, cancellations or failures to give notice, individually or in the aggregate, would not have a material adverse effect on the Acquired Assets, the Assumed Liabilities or the ability of the parties to consummate the transactions contemplated by this Agreement (a "Material Adverse Effect"). Seller need not give any notice to, make any filing with, or obtain any authorization, consent, or approval of any government or governmental agency in order for the parties to consummate the transactions

<PAGE>

contemplated by this Agreement, except where the failure to do so, individually or in the aggregate, would not have a Material Adverse Effect.

A. CONSENTS. No approvals or consents of or assignments by any person (including any federal, state or local governmental or administrative authorities) are necessary in connection with the execution, delivery or performance of this Agreement.

A. TITLE TO THE ACQUIRED ASSETS. Seller has good and marketable title, free and clear of all Liens, (i) to the Acquired Assets identified on SCHEDULE 1 (other than copyrights that are not identified on SCHEDULE 4), SCHEDULE 3 and SCHEDULE 4 and (ii) to its Knowledge, to all other Acquired Assets. At the Closing, Buyer shall obtain good and marketable title, free and clear of all Liens (i) to the Acquired Assets identified on SCHEDULE 1 (other than copyrights that are not identified on SCHEDULE 4), SCHEDULE 3 and SCHEDULE 4 and (ii) to its Knowledge, to all other Acquired Assets.

A. MATERIAL CONTRACTS. True, correct and complete copies of the License Agreements have been delivered to Buyer. Seller has performed in all material respects all obligations required to be performed by Seller under the License Agreements. To the Knowledge of Seller, each of the other parties to

the License Agreements has performed in all material respects all the obligations required to be performed by them thereunder to date. Each License Agreement (i) is valid, binding and enforceable in accordance with its terms, (ii) is in full force and effect with no default or dispute existing or, to the Knowledge of Seller, threatened with respect thereto, and (iii) shall not be terminated or otherwise affected by the execution and delivery of this Agreement or the consummation of the transactions contemplated hereby. No consent of any third party is required for the assignment of any License Agreement to Buyer. Seller has provided Buyer with a complete and accurate list of payments paid to Seller by each licensee under the License Agreements, indicating the licensee and the month paid, from June 30, 1996 to present. Seller has not received any advanced payments (including prepayments of royalties, or other payments by reason of which a licensee is entitled to reduce its current or future royalty or payment obligations) under the License Agreements which have not been earned by Seller.

A. INTELLECTUAL PROPERTY.

1. To the Knowledge of Seller, SCHEDULE 1 contains a list of all trademarks and service marks and applications therefor included in the Acquired Assets that have not lapsed and that are, except as qualified therein, Registered Intellectual Property (the "Registered Marks"), all patents and applications therefor that are included in the Acquired Assets that are Registered Intellectual Property (the "Registered Patents"), and United States copyrights included in the Acquired Assets, certain of which are Registered Intellectual Property. SCHEDULE 3 contains certain game titles that are included in the Acquired Assets. To the Knowledge of Seller, (A) the description of the Registered Marks on SCHEDULE 1 contains, to the extent set forth and

<PAGE>

except as qualified therein, the true and accurate date of registration, registration number, registered owner and the class of the Registered Marks, (B) the description of the Registered Patents on SCHEDULE 1 contains the true and accurate patent number and file date of the Registered Patents, and (C) the description of the United States registered copyrights on SCHEDULE 1 included in the Acquired Assets that are Registered Intellectual Property contains the number of such copyright registration.

1. Since July 30, 1996, to the extent that any Seller's Intellectual Property has been developed by any Person other than Seller for which Seller has, directly or indirectly, paid, Seller has a written agreement with such Person with respect thereto and thereby has obtained ownership of,

and
recordable title to, and is the exclusive owner of, all developed Seller's Intellectual Property by operation of law or by valid assignment.

1. Except as set forth in any License Agreement, Seller has not transferred ownership of or granted any license of or right to use or authorized the retention of any rights to use any Seller's Intellectual Property to any other Person.

1. The Seller's Intellectual Property constitutes all Intellectual Property used in and/or necessary to the conduct of Seller's Atari division business as currently being conducted by Seller.

1. To the Knowledge of Seller, neither Seller's Products included in the Acquired Assets nor the use of Seller's Intellectual Property, (A) infringes upon or misappropriates the Intellectual Property of any Person, (B) violates the rights of any Person (including rights to privacy or publicity), or (C) constitutes unfair competition or trade practices under the laws of any jurisdiction. Seller has received no notice from any Person claiming that Seller's Products included in the Acquired Assets nor the use of Seller's Intellectual Property infringes upon or misappropriates the Intellectual Property of any Person or constitutes unfair competition or trade practices under the laws of any jurisdiction (nor, to the Knowledge of Seller, is there any basis therefor).

1. There are no contracts, licenses or agreements between Seller and any other Person with respect to Seller's Intellectual Property under which there is, to the Knowledge of Seller, any dispute or any threatened dispute regarding the scope of such agreement, or performance under such agreement including with respect to any payments to be made or received by Seller thereunder.

1. To the Knowledge of Seller, no Person is infringing or misappropriating any Key Mark, other than such infringements or misappropriations that, individually or in the aggregate, would not have a Material Adverse Effect on such Key Mark.

<PAGE>

1. Seller and, to the Knowledge of Seller, each prior owner of the Seller's Intellectual Property have taken whatever reasonable steps that are required to protect rights in confidential information and trade secrets of such Person and its successors.

1. None of the Seller's Intellectual Property is subject to any

proceeding or outstanding decree, order, judgment, agreement or stipulation that
restricts in any manner the use, transfer or licensing thereof by Seller or may
affect the validity, use or enforceability of such Seller's Intellectual Property.

1. Seller is not required to make or accrue any royalty payment
to any third party in connection with the sale, distribution, license, transfer
or other disposition or exploitation of any of the Acquired Assets.

1. Seller has not developed any new video game software since July 30, 1996.

1. Seller owns no Intellectual Property not included in the Acquired Assets that is directly or indirectly competitive with the Seller's Intellectual Property.

1. (A) Alan Helbush is the Administrative Contact listed in the domain name record on file with Network Solutions, Inc./InterNIC Registration Services, and (B) Seller controls the domain name "ATARI.COM".

1. None of the Intellectual Property associated with the Seller's Products, including the Intellectual Property identified on SCHEDULE 1,
or remedies past and future against infringements thereof and rights to protection of interest therein is an asset specified in clause (g) of the definition of "Excluded Assets" set forth in Section 1.

A. SUFFICIENCY OF ASSETS. The Acquired Assets include all assets, properties and rights necessary for compliance by Buyer with all obligations relating to the Assumed Liabilities.

A. LITIGATION. There is no claim, dispute, action, proceeding (including arbitration), suit or appeal, or investigation, at law or in equity,
pending (other than those, if any, with respect to which service of process or similar notice has not yet been made and which are not within the Knowledge of Seller) or, to the Knowledge of Seller, threatened against Seller or involving any of the assets or properties of Seller before any court, agency, authority, arbitration panel or other tribunal that would have a Material Adverse Effect.

There is no outstanding order, writ, injunction or decree of any court, agency,
authority, arbitration panel or other tribunal, and Seller is not in default with respect to any notice, order, writ, injunction, or decree, in each case relating to, or affecting the Acquired Assets, the Assumed Liabilities or the Seller's Products.

A. UNDERLYING DOCUMENTS. Copies of all documents listed or described in the Disclosure Schedule and the Schedules hereto have been furnished or made available to Buyer. All such documents are true, correct and complete copies, and there are no amendments or modifications thereto.

A. BROKERS' FEES. Seller has no liability or obligation to pay any fees or commissions to any broker, finder, or agent with respect to the transactions contemplated by this Agreement for which Buyer or its affiliates could become liable or obligated.

A. COMPLIANCE WITH BULK SALES LAWS. The sale, transfer and assignment by Seller to Buyer hereunder and the consummation of the other transactions contemplated hereby do not constitute a "bulk sale" by Seller, and it is not necessary under the laws of any jurisdiction that Seller comply with the bulk sales laws of such jurisdiction.

A. DISCLOSURE. Neither this Agreement nor any of the Schedules nor, to the Knowledge of Seller, any other documents delivered by Seller in connection with this Agreement contains any untrue statement of a material fact or omits a material fact necessary to make the statements contained herein or therein, in light of the circumstances in which they were made, not misleading, and, to the Knowledge of Seller, there is no fact that has not been disclosed to Buyer that materially affects adversely or could reasonably be anticipated to materially affect adversely the Acquired Assets, or the operation of the Acquired Assets by Buyer as currently conducted by Seller.

I. REPRESENTATIONS AND WARRANTIES OF BUYER. Buyer represents and warrants to Seller that the statements contained in this Section 4 are correct and complete as of the Closing.

A. ORGANIZATION OF BUYER. Buyer is a corporation duly organized, validly existing, and in good standing under the laws of the state of Delaware.

A. AUTHORIZATION OF TRANSACTION. Buyer has full power and authority (including full corporate power and authority) to execute and deliver this Agreement and to perform its obligations hereunder. This Agreement constitutes the valid and legally binding obligation of Buyer, enforceable in accordance with its terms. The person who has executed this Agreement on behalf of Buyer has been duly authorized to do so.

A. BROKERS' FEES. Buyer has no liability or obligation to pay any fees or commissions to any broker, finder, or agent with respect to the transactions contemplated by this Agreement for which Seller or its affiliates

could become liable or obligated.

<PAGE>

A. NONCONTRAVENTION. Neither the execution and delivery of this Agreement by Buyer, nor the consummation by Buyer of the transactions contemplated hereby, will violate (a) any provision of the Certificate of Incorporation or bylaws, as amended, of Buyer or (b) any statute, regulation, rule, judgment, order, decree, stipulation, injunction, charge or other restriction of any government, governmental agency or court to which Buyer is subject.

A. ASSESSMENT OF VALUE. Buyer has been authorized by its ultimate parent entity to make a good faith assessment of the fair market value of the Acquired Assets, has made such assessment, and has determined that the fair market value of the Acquired Assets as of the Closing is less than $15,000,000.

I. POST-CLOSING COVENANTS AND AGREEMENTS.

A. COOPERATION. Each party shall, at all times following the Closing, not take any action inconsistent with the satisfaction of its obligations hereunder and, subject to the following sentence, shall promptly take any further action necessary or desirable to carry out the purposes of this Agreement (including the execution and delivery of such further instruments and documents) as the other party may reasonably request. Seller shall take all actions reasonably requested by Buyer, at Buyer's expense (provided that Buyer shall not be obligated for any cost to Seller in respect of the time of Seller's employees, officers or directors), to enable Buyer to establish a recordable chain of title to the Acquired Assets, including contacting prior owners of items thereof to request appropriate instruments for recordation.

A. DELIVERY. Immediately following the Closing Seller shall deliver to Buyer, and Buyer shall accept and remove from Seller's premises at Buyer's expense within 30 days of the date of Closing, all copies of tangible embodiments of Acquired Assets transferred to Seller (other than software and code, and such other items as the parties may mutually agree, which shall be transferred electronically on or immediately following the Closing and all tangible embodiments of which shall thereafter be destroyed by Seller); PROVIDED, HOWEVER, that (i) any information contained in such materials listed in clause (e) of the definition of "Acquired Assets" that does not relate to the Acquired Assets may be deleted by Seller before such materials are delivered to Buyer and (ii) Seller may make copies of any business or financial documents (other than documents containing Seller Intellectual Property) prior to delivering them to Buyer. Except as provided in Section 5(c), Seller shall cease use of the Seller's Intellectual Property, including the name Atari and the "Fuji" logo relating thereto.

A. SELLER INVENTORY. Seller owns certain unsold inventory of games bearing the Atari and/or Fuji trademark, and certain other Registered Marks and containing other Seller's Intellectual Property (the "Inventory"). Buyer hereby grants to Seller an irrevocable, worldwide, royalty-free license, for a period of one year from the date of the Closing to use the Registered Marks and other applicable Seller's Intellectual

<PAGE>

Property relating to such Inventory solely for the purpose of selling the Inventory. Except as set forth in the previous sentence, after the Closing Seller shall have no right to exploit the Seller's Intellectual Property. Without limiting the foregoing, Seller shall not, following the expiration of the one-year license period set forth above, sell any product referred to in clause (e) of the definition of "Excluded Assets" set forth in Section 1. Seller warrants that the Inventory sold pursuant to this Section 5(c) shall be of like kind and quality to that previously sold by Atari Corporation in the ordinary course of its business.

A. NOTICE OF DEVELOPMENTS. Seller shall give prompt written notice to Buyer of any material development that could have a Material Adverse Effect. Each party shall give prompt written notice to the other of any material development affecting the ability of the parties to perform their post-Closing obligations under this Agreement.

A. ENFORCEMENT OF RIGHTS. In connection with the enforcement of its rights of ownership of the Acquired Assets and the enjoyment thereof, Buyer may bring actions in the name of Seller, or cause Seller to join any such action as a party, as reasonably necessary, provided that Buyer shall indemnify Seller with respect thereto.

A. MAINTENANCE OF INTELLECTUAL PROPERTY; DELIVERY OF NOTICES. After the Closing, Seller shall not be responsible for the maintenance or renewal of any registration with respect to the Acquired Assets, such responsibility to belong to Buyer as the owner of the Acquired Assets; PROVIDED, HOWEVER, that Seller shall promptly forward to Seller any and all notices and correspondence which it may receive pertaining to the Acquired Assets; and FURTHER PROVIDED that Seller shall remain responsible for the maintenance and renewal of registration with respect to all of the Consent-Required Assets retained by Seller pursuant to Section 2(d) of this Agreement as a consequence of the failure to obtain a required consent of a third party until such time as the applicable consent is obtained.

A. LITIGATION SUPPORT. In the event and for so long as Seller actively is contesting or defending against any action, suit, proceeding, hearing, investigation, charge, complaint, claim or demand in connection with any fact, situation, circumstance, status, condition, activity, practice, plan, occurrence, event, incident, action, failure to act, or transaction involving the Acquired Assets or the Assumed Liabilities, Buyer will provide access upon prior request and during its regular business hours to the books, records and other items specified in clause (e) of the definition of Acquired Assets set forth in Section 1 as shall be reasonably necessary in connection with the contest or defense, all at the sole cost and expense of Seller and subject to Seller's execution and delivery of Buyer's standard form of confidentiality agreement with respect to such items.

<PAGE>

I. INDEMNIFICATION.

A. INDEMNIFICATION AND REIMBURSEMENT OF BUYER'S LOSSES. Seller shall indemnify Buyer and its affiliates, together with their respective officers, directors and employees (each a "Seller's Indemnitee") against Losses (as defined below) as set forth in this Section 6. If a Seller's Indemnitee shall have suffered a Loss by reason of (i) the breach of any of the representations or warranties made by Seller herein, (ii) any matter arising prior to the Closing with respect to the Seller's business, an Acquired Asset or an Assumed Liability, (iii) any liability of Seller that is not an Assumed Liability or (iv) any breach of a covenant of Seller hereunder, Seller's Indemnitee shall be reimbursed for such Loss by Seller as set forth in this Section 6. For purposes hereof, "Loss" shall mean any losses, liabilities, claims, damages and expenses incurred or reasonably expected to be incurred, including penalties, fines, interest, amounts paid in settlement and reasonable fees and disbursements of counsel, and expenses incurred in connection with any investigation, action, suit or proceeding instituted against an indemnified party. Notwithstanding the foregoing, Seller shall have no obligation to indemnify Seller's Indemnitees for Losses which, cumulatively, total less than $25,000; PROVIDED, HOWEVER, that if cumulative Losses equal or exceed said $25,000, then Seller shall indemnify Seller's Indemnitees for all of such Losses. Liquidated Claims (as defined below) actually paid by Seller under this Section 6 shall be limited to an aggregate of $5 million.

A. INDEMNIFICATION AND REIMBURSEMENT OF SELLER'S LOSSES. Buyer shall indemnify Seller and its affiliates, together with their respective officers, directors and employees (each a "Buyer's Indemnitee") against Losses as set forth in this Section 6. If a Buyer's Indemnitee shall have suffered a Loss by reason of (i) the breach of any of the representations or warranties made by Buyer herein, (ii) any matter arising after the Closing with respect to the Buyer's business, an Acquired Asset or an Assumed Liability, provided such

matter is not related to or arising from any breach of a covenant, representation or warranty of Seller or any act or omission by Seller involving
wilful misconduct, fraud or bad faith, or (iii) any breach of a covenant of Buyer hereunder, Buyer's Indemnitee shall be reimbursed for such Loss by Buyer as set forth in this Section 6. Notwithstanding the foregoing, Buyer shall have
no obligation to indemnify Buyer's Indemnitees for Losses which, cumulatively, total less than $25,000, provided however that if cumulative Losses equal or exceed said $25,000, then Buyer shall indemnify Buyer's Indemnitees for all of such Losses. Liquidated Claims actually paid by Buyer under this Section 6 shall be limited to an aggregate of $5 million.

A. PAYMENT. At such time as the reimbursable amount of a Claim or a
Third Party Claim has been determined in accordance with this Section 6 (a "Liquidated Claim"), the indemnifying party shall immediately pay the Person to
be indemnified hereunder (an "Indemnitee") the amount of the Liquidated Claim.

No forbearance of an Indemnitee in demanding payment from the indemnifying party
shall act as a waiver of any right of an Indemnitee to receive payment from the
indemnifying

<PAGE>

party, nor shall it relieve the indemnifying party of any obligation to an Indemnitee under this Agreement.

A. NOTICE OF CLAIMS. In the event an Indemnitee has any claim for indemnification under Section 6(a) or Section 6(b) (a "Claim"), it shall give prompt written notice thereof to the indemnifying party, including in such notice a brief description of the facts upon which such claim is based and the amount thereof.

A. THIRD PARTY CLAIMS.

1. If any third party shall notify an Indemnitee with respect to any matter (a "Third Party Claim") that may give rise to a claim for indemnification against a party hereto (the "Indemnifying Party") under this Section 6, then the Indemnitee shall promptly notify the Indemnifying Party thereof in writing; PROVIDED, HOWEVER, that no delay on the part of the Indemnitee in notifying the Indemnifying Party shall relieve the Indemnifying Party from any obligation hereunder, unless (and then solely to the extent) that
the Indemnifying Party is prejudiced.

1. The Indemnifying Party shall have the right to defend the Indemnitee against the Third Party Claim with counsel of the Indemnifying Party's choice reasonably satisfactory to the Indemnitee so long as (A) the Indemnifying Party notifies the Indemnitee within 15 days after the Indemnitee

has given notice of the Third Party Claim that the Indemnifying Party will indemnify the Indemnitee as required by (and subject to the limitations of) this
Section 6 for Losses arising out of, relating to, in the nature of, or caused by
the Third Party Claim; (B) the Indemnifying Party provides the Indemnitee with evidence reasonably acceptable to the Indemnitee that the Indemnifying Party will have the financial resources to defend against the Third Party Claim and fulfill its indemnification obligations hereunder; (C) the Third Party Claim involves only money damages and does not seek an injunction or other equitable relief; (D) settlement of, or an adverse judgment with respect to, the Third Party Claim is not, in the good faith judgment of the Indemnitee, likely to establish a precedential custom or practice materially adverse to the continuing
business interest of the Indemnitee; and (E) the Indemnifying Party conducts the
defense of the Third Party Claim actively and diligently.

1. So long as the Indemnifying Party is conducting the defense
of the Third Party Claim in accordance with Section 6(e)(ii) above, (A) the Indemnitee may retain separate co-counsel at its sole cost and expense and participate in the defense of the Third Party Claim; (B) the Indemnitee shall not consent to the entry of any judgment or enter into any settlement with respect to the Third Party Claim without the prior written consent of the Indemnifying Party (not to be withheld unreasonably); and (C) the Indemnifying Party shall not consent to the entry of any judgment or enter into any settlement with respect to the Third Party Claim without the prior written consent of the Indemnitee (not to be withheld unreasonably).

<PAGE>

1. In the event any of the conditions in Section 6(e)(ii) above
is or becomes unsatisfied, however, (A) the Indemnitee may defend against, and consent to the entry of any judgment or enter into any settlement with respect to, the Third Party claim in any manner it reasonably may deem appropriate (and
the Indemnitee need not consult with or obtain any consent from, any Indemnifying Party in connection therewith); (B) the Indemnifying Party shall reimburse the Indemnitee promptly and periodically for the reasonable costs of defending against the Third Party Claim (including attorneys' fees and expenses), and (C) the Indemnifying Party shall remain responsible for any Losses the Indemnitee may suffer resulting from, arising out of, relating to, in
the nature of, or caused by the Third Party Claim to the fullest extent provided
in this Section 6.

A. DISPUTED CLAIMS. If Seller objects to any Claim or Third Party Claim, it shall give written notice of such objection and brief statement of the
grounds of such objection to Indemnitee within 20 business days after notice

is
received. If no such objection is given, such Claim or Third Party Claim, as the case may be, shall be a Liquidated Claim. If such objection is made, Indemnitee and Seller shall meet and use their best efforts to settle the dispute in writing that when resolved shall be a Liquidated Claim.

A. SURVIVAL. The provisions of this Section 6 shall survive the Closing. Notwithstanding anything to the contrary in this Agreement, no Claim or Third Party Claim may be asserted by a Seller's Indemnitee under this Section
6: (i) with respect to Losses arising in connection with the obligation to pay
taxes, following the date of the expiration of the applicable statute of limitations for such obligation; (ii) with respect to a Loss arising out of or in connection with a License Agreement, following the termination of such License Agreement in accordance with its terms; and (iii) with respect to all other Losses, following August 31, 2000. No Claim or Third Party Claim may be asserted by a Buyer's Indemnitee under this Section 6, other than Losses arising
with respect to the Assumed Liabilities, following August 31, 2000. Notwithstanding the preceding sentence, an Indemnitee may assert a Claim or Third Party Claim under this Section 6 with respect to Losses that are the result of fraud or wilful misconduct by the Indemnifying Party at any time within the applicable statute of limitations for such claim.

A. The right of each party hereto to assert Claims and receive indemnification payments pursuant to this Section 6 shall be the sole and exclusive right and remedy exercisable by such party with respect to any breach
by the other party hereto of any representation or warranty or failure to perform any covenant required to be performed by such other party; PROVIDED, HOWEVER, that the above shall not prevent a party hereto from seeking specific performance of a covenant which another party hereto has failed to perform under
this Agreement.

I. MISCELLANEOUS.

<PAGE>

A. NO THIRD PARTY BENEFICIARIES. Except as otherwise specified herein, this Agreement shall not confer any rights or remedies upon any person other than the parties and their respective successors and permitted assigns.

A. ENTIRE AGREEMENT. This Agreement (including the documents referred to herein) constitutes the entire agreement between the parties and supersedes any prior understandings, agreements, or representations by or between the parties, written or oral, that may have related in any way to the subject matter hereof.

A. SUCCESSION AND ASSIGNMENT. This Agreement shall be binding upon
and inure to the benefit of the parties named herein and their respective

successors and permitted assigns. Seller shall not assign any of its rights, interests or obligations hereunder without the prior written consent of Buyer.

Buyer may assign its right, interests and obligations hereunder to any Person provided that such permitted assignee agrees to be bound by the terms hereof and
to assume all obligations of Buyer hereunder.

A. COUNTERPARTS. This Agreement may be executed in one or more counterparts, each of which shall be deemed an original but all of which together shall constitute one and the same instrument.

A. HEADINGS. The section headings contained in this Agreement are inserted for convenience only and shall not affect in any way the meaning or interpretation of this Agreement.

A. NOTICES. All notices, requests, demands, claims, and other communications hereunder in writing. Any notice, request, demand, claim, or other communication hereunder shall be deemed duly given five business days after mailing if sent by registered or certified mail, return receipt requested,
postage prepaid and addressed to the intended recipient as set forth below:

If to Seller:

JTS Corporation
1661 Baypointe Parkway
San Jose, California 95134
Attention: President

Copy to:

Cooley Godward LLP
5 Palo Alto Square
Palo Alto, California 94306
Attention: Andrei M. Manoliu, Esq.

<PAGE>

If to Buyer:

HIAC XI, Corp.
1027 Newport Avenue
Pawtucket, Rhode Island 02862
Attention: President

Copy to:

Hasbro, Inc.
1027 Newport Avenue
Pawtucket, Rhode Island, 02862
Attention: General Counsel

Copy to:

Wilson Sonsini Goodrich & Rosati
650 Page Mill Road
Palo Alto, California 94304
Attention: Eric W. Wright, Esq.

Any party may give any notice, request, demand, claim, or other communication hereunder using any other means (including personal delivery, expedited courier, messenger service, facsimile, telex, ordinary mail, or electronic mail), but no such notice, request, demand, claim, or other communication shall be deemed to have been duly given unless and until it is received by the person for whom it is intended. Any party may change the address to which notices, requests, demands, claims, and other communications hereunder are to be delivered by giving the other party notice in the manner herein set forth.

A. GOVERNING LAW. This Agreement shall be governed by and construed in accordance with the laws of the State of California as such laws are applied to agreements entered into and to be performed entirely within California by California residents.

A. AMENDMENTS AND WAIVERS. No amendment of any provision of this Agreement shall be valid unless the same shall be in writing and signed by Buyer and Seller.

A. EXPENSES. Each of Buyer and Seller shall bear its own costs and expenses (including legal fees and expenses) incurred in connection with the negotiation and preparation of this Agreement and the transactions contemplated hereby. Buyer shall, pursuant to Section 5(a) of this Agreement, bear all costs and expenses of the recordation of chain of title to the Acquired Assets, including preparation and recordation of appropriate assignments of the Acquired Assets.

<PAGE>

A. CONSTRUCTION. The language used in this Agreement shall be deemed to be the language chosen by the parties to express their mutual intent, and no rule of strict construction shall be applied against any party. Any reference to any federal, state, local, or foreign statute or law shall be deemed also to refer to all rules and regulations promulgated thereunder, unless the context requires otherwise. Except as otherwise specified, references in this Agreement to Sections and Schedules are to Sections of, and Schedules

attached to, this Agreement. Except where the context clearly requires to the contrary, "including" shall mean "including, without limitation".

A. SCHEDULES. The Schedules identified in this Agreement are incorporated herein by reference and made a part hereof.

A. TRANSFER TAXES. Any and all sales, use or other transfer taxes arising from the transactions contemplated by this Agreement shall be paid by Seller.

A. CONFIDENTIALITY OF INFORMATION. All information given to a party by the other party in connection with this Agreement ("Confidential Information") shall be used only for purposes related to the consummation of the transactions contemplated herein, and shall be disclosed to the receiving party's employees and representatives only on a "need to know" basis in connection with such purposes. If the Closing does not occur for any reason, each party shall maintain in confidence all Confidential Information of the other party, shall return to the disclosing party all tangible embodiments (and all copies) of such Confidential Information and shall not use such Confidential Information for any purpose; PROVIDED, HOWEVER, that the forgoing restrictions shall not apply to: (i) information that is or becomes a matter of public knowledge through no act or failure to act of the receiving party, its representatives or employees, (ii) information that becomes available to the receiving party from a source not under an obligation of confidentiality to the disclosing party, or (iii) information that was known to receiving party prior to its disclosure to the receiving party by the disclosing party.

IN WITNESS WHEREOF, the parties have executed this Asset Purchase Agreement on the date first above written.

HIAC XI, CORP.

I wonder what plans Hasbro has for atari. Theres' $$ in the arcade
division and home console games division. Hehe MAybe we'll see a new
atari console; then again maybe not hehehe.

Now, the question is, will Hasbro Interactive do anything worthwhile with Atari. I did notice that the computers were specifically listed as being part of the deal. It makes me curious that they specifically mentioned the computers (8-bit, ST, Falcon, and TOS), so does that mean there is some plan to use this for something? I mean, $5 million for Atari is a good chunk of money. I wonder who we can get to tell more of this deal. Sure enough $5 mil is not worth it for Atari's management.....

Maybe Hasbro has a game system in the works and wants to use the Atari label.....

I'm sure in the coming months rumors will start to appear everywhere!

$5 million is actually a very small sum of money for the name alone, if the right people can act upon the right memories of the right consumers. That the computer lines are included is either complementary or central to their plans; that's what we'll be watching for. Don't necessarily expect anything right off the bat. Many wise investors, seeing an opportunity, act well in advance of any plans, buying when others are fleeing... a la Warren Buffet buying 20% of worldwide above-ground silver reserves recently. He's just waiting... he can afford to.

I thought I recently heard that Hasbro was laying off several hundred employees and closing a plant. I wonder if the Atari purchase has anything to do with this. Could be a refocusing of their management's vision. Hmmm... an Atari web-box? No reason you can't sell one today for $99.

Considering Hasbro's success with the Frogger remake (as lousy as it was, it did sell), I bet Hasbro is just chomping at the bit to re-release some of Atari's back catalog in anticipation of similar success. Somehow I doubt Hasbro will do anything with the hardware, but who knows. Maybe they will incorporate it into some kind of toy, like a Pico-style device.

5 million is chump change for Hasbro, especially after just having
purchased Tiger Electronics last month (Feb 9th) for 335 million.
Which leads me to....

>Maybe Hasbro has a game system in the works and wants to use the Atari
>label.....

My conspiratorial mind is highly curious if there might end up being
some form of game.com / Atari collaboration now. Perhaps use the Lynx

technology to give the Com a much-needed shot in the arm?

>I'm sure in the coming months rumors will start to appear everywhere!

Why wait months when we can start now? :)

Not necessarily, the agreement merely spells out that Hasbro gets all
the
assets of Atari, from video games to computers. It doesn't mean Hasbro
is
going to release computers, just says they now own all the
rights/patents/etc.
to the computer line.

Essentially, JTS is transferring everything under the Atari label to
Hasbro.

>

who knows, but Hasbro has been trying to do their own game system for
God knows
how long...

They started with the VCR based system (Sewer Shark, Night Trap were
spawned from) and
not to long ago, where experimenting with an elaborate Virtual Reality
system that
suddenly went away.....

I'm sure we'll know something perhaps by E3.....

my best guess...

    Jo Even Skarstein <joska@nuts.edu> writes:

> Is it possible to use both a icon and a string as a meny-entry? And if
> so, how?

Just place them there, should work. If you want *both* being combined into a single entry, try to make the string rectangle larger such that it covers the icon, this should work if G_ENTRY is transparent (I'm not sure). If it's not, put another IBOX on top of both, and use the IBOX as the menu entry for getting inverted etc.

Cheers Peter

Atari does NOT have an arcade division. It's a long story, but the end
result of it all is that Atari Games, the arcade game maker, is now a
division of Williams (maker of Defender, Sinistar, etc...).

As for a new Atari console... I wonder if Hasbro is a Project X
licensee?

Not really. Consider the staggering number of patents and licenses
involved. Hell, just look at those "key marks" that are mentioned - the
Atari name, Fuji logo, Centipede, Crystal Castles, Yar's Revenge, and so
on, and so on! That alon is worth a ton of bucks. (Well, to me anyway!)

Hello,

I'm looking for the person who posted a little while back about obtaining
a compilier for GFA BASIC. Well I've seemed to loose your E-Mail
address so if you see this message, please Re-Email me so I can get your
E-Mail address once again.

Didn't Hasbro already inherit the corpse of Coleco? Fifteen years
after the 1982 home video game wars, the two big players end up as
bunkmates. :)

: 5 million is chump change for Hasbro, especially after just having
: purchased Tiger Electronics last month (Feb 9th) for 335 million.
: Which leads me to....

Atually, for all that Atari embodies, $5 million is dirt cheap. The
question is, did they finally get rid of the Tramiel family...

: My conspiratorial mind is highly curious if there might end up being
: some form of game.com / Atari collaboration now. Perhaps use the Lynx
: technology to give the Com a much-needed shot in the arm?

Why would they want to do something with the Lynx, although it probably
was the cheapest portable game technology they could get, could make them
cheap now...

: Why wait months when we can start now? :)

Basically I see three scenarios....

1) They wanted the games, to follow the froger path...
2) They wanted the name for a new game system or other application...
3) They couldn't pass on the price with all of the pack ins they are
getting.... all of Ataris technology and patents for the last 20 years....

Somehow, the "Hasbro Falcon030" just doesn't have
the same cachet. (I'd even prefer a "Wizztronics
Falcon030", come to think of it!)

Greetings!

There was a recently-posted request that programs should stop after printing text to the screen (when exiting) so the user could view the information before the desktop reappears.

After some toying around with a variety of commands, I've come up with a fairly-simple (although heavily commented!) demonstration function called pause_here(). It won't stop existing programs, but programmers developing new software will find this code easy to implement.

It recognizes any user's keypress (even the wiseguys who press SHIFT or CONTROL) with the exception of CAPS LOCK, which apparently only connects to the IKBD processor and not to the Central Processing Unit. As a bonus, it will recognize mouse clicks, as well.

A compiled GEM program containing this function will be posted as "Two Bit Tutorial Number 1" (probably in the binaries group) soon. It will NOT need a resource (*.RSC) file for proper operation, so don't worry that it doesn't have one! (You can rename it PAUSE.TOS, if the lack of a resource file causes problems.)

This makes sense too. First of all the Lynx is by no means outdated
considering how far handheld consoles go these days. Secondly no one
seems to want a Tiger Game.com, maybe they want and Atari Game.com.
Secondly, purchasing two game companies leads me to believe they have
something planned. Perhaps Hasbro will make a console, portable or
standard (or even liscense Project X) and use technology from both
companies or names to form something.

I would think the want the Atari name perhaps for something else. Maybe
they want to release the Jaguar 2 and try to beat Playstation, in
theory it is more powerful than current consoles and could compete with
the next according to the few rumors surrounding it.

 Thanks for the info. I read the document and one very interesting part
is
the fact that Hasbro will take the rights to the website domain
"atari.com"
It looks like Hasbro will be using the name Atari for something, but
what
that might be is still up for speculation.

When Atari bought into JTS there were many who said that Atari was DEAD!

It definately looks like some restoration will be happening.

Thank you Hasbro in advance for whatever you may do!

Patrick Mulvey
Pres. LIAUG

Hehehee.. I'm not sure I like any of them. Someone wanted to start some rumors, here is one. I guess you all know of VM-Labs which are supposed to cooperate with a number of big companies. I have no idea what Hasbro does, but maybe JHasbro+VM-Labs have something to do with this as well? :-)

Another possibility would be that it would be esier for a seconde company to buy out the computer part and TOS. As they sold the whole shit for 5 mill, I guess the computer part would be very cheap as I guess this is not what they were after in the first place.

Well, maybe IBM could buy the computer and release a PPC TOS box, or Compac or Dell could buy it just for the fun to rival Gateway2000? The price for the computer part would be a fart in space for those guys. :-)))))

Anyway, here you are.

That is the point. With a Nova card you wont even get a useable VBL so
you can't make games which runs on graphics cards to use the VBL like
Peter said, or whoever it was talking about VBLs.

If they aren't intrested in the computer line or TOS, perhaps we can see
TOS under a open license or even freely aviable. The same goes for the
hardware schematics, sadly there isn't much money left in a computerline
that was abadoned some 5 years ago, even if one as a enthusiast like myself
don't like that fact. Today people buys a PC not a homecomputer... ;-(But
perhaps Hasbro are more open than JTS where.

Just my 2 cents.

Regards..

i believe those lay offs were planned to come at the factory in rhode
island. though i doubt that really has anything to do with the atari
purchase.

It occurs to me that if we all pooled our money together, WE could have
bought Atari! C'mon guys, 50 of us with $100K a piece could do it.

The layoff had to do with Hasbro doing away with unprofitable toy lines and
closing down an out of date factory. Nothing that doesn't happen from time to
time.

Whew! i want to say that I dont care if Hasbro does nothing with Atari. Just
so long as Atari didn't die at the hands of the Trameils!!!! I hope this all
works out and Atari escapes to Hasbro. JTS is about to be eaten by
stockholders.

Yeah, why not? :) Seriously. not more than three months ago I was reading
that Atari and the logo is still one of the most reconized brand names in the
world. On par with Coke, and RCA. My pet theory is has Hasbro
interactive/Tiger will become Atari for name awareness purposes. Rumors about
a year ago were running around that Tiger was developing a console system. I
imagine that, even with the bad press Atari has gotten, an Atari system will
sell better than a Tiger system. In the short term, I imagine that we'll see
retro games with Atari on it. Let me throw a few more logs in the rumor mill.
(Mostly from speculation) 1. Notice that midway and WMS were spliting up? I
wonder if Atari Games will come available for sale? hmmmmm... 2. Everyone is
saying Project X. I think if that was the case, next Generation would be
crowing louder. They know who the Project X partners are already. Oh the
other hand, maybe thats why they didn't want to say to much back in Janurary.
in either case, I'm sure we'll hear it there first. 3. Yars Revenge X...

I would be supprised if anyone producing
(useful) software couldn't code their own
"wait key" routine...

```
> /* and evnt_keybd() ignore a variety of keys  *
> /* such as:  F1-F10, RETURN, ENTER, HELP,     */
> /* UNDO, arrow keys, DELETE, INSERT, and      */
> /* CLRHOME.                                   */
```

Actually, thats not true, it works fine here (just different, as they
all have an ASCII code of zero - you have to use scancode instead).

Thats true, I suppose they could have let the site die if they had no
use for it, but since they took the site it would seem that they plan
on using it for something. I also noticed if I try to go to
http://www.atari.com it just sits hangs, claiming it is connecting, but
nothing becomes of it.

I was referring to the Tiger Game.com console perhaps being renamed as
something dealing with Atari since they are not selling well.

I would guess JTS was too strapped for cash to try to do anything with
Atari. Perhaps that is why they were not open with Atari, they wanted
to liscense stuff to make money.

So perhaps we should petition Hasbro to make some of the old Atari
8-bit and ST stuff freeware.

Maybe make the custom chip details public, and license theem for free
non-comercial (or limited production, say under 1000 units) use.

Perhaps relase the source for the various operating systems under
something like the Netscape Public License.

I think we should think about what they could do that would:
 a) make us hobiests happy
 b) not provide any advantage to their competitors
 c) not deprive them of potential future revenue
 d) not cost them much of anything to release

I'm not convinced that all use of line-A is ill advised, especially when
there seems no other way to do what you are doing. Using $Axxx calls to
create graphics or text should no longer be done, true. But once you

know where the line-a variables are, I don't see a problem with
accessing them from within a BIOS handler, or wherever; because that has
long been a common practice, I think all TOS versions and all existing
display drivers and accelerators support those variables, at least those
documented variables having to do with VT52 (does anyone here know
otherwise?). You probably want to keep your $a000 call in the
installation phase, rather than invoking it on the fly later, again to
keep line-A calls out of the bios handler. Probably you already are
doing this.

The only way I can think of to do this and have it work would be to use G_PROGDEFs and roll your own. The AES is very picky about the hierarchy of menus, and you can't just add a new object.

ho dear...sorry

http://www.users.zetnet.co.uk/paxton/stosser/home.htm

This will take you to the main STOSSER pages.. as could have got to
from paxton :)

From here simple choose STOSSER Titles, there you will get a list of
all titles.. you click on and get a full rundown including screen
shots and independant reviews where applicable,

OR....you can simple download the whole STOSSER site as a zip file for
offline reading at
http://www.users.zetnet.co.uk/paxton/zips/stosser.zip

Its 736kb but holds maybe 70 gifs and about 70+ html files all
pertaining to stosser software :)

I take it you saw the ST+Fanzine site... its doing well. lots of
companies are now taking it and giving copies away with orders...
advertising is FREE .<SMILE>

You can grab the whole ST+ Fanzine site for offline reading as well
http://www.users.zetnet.co.uk/paxton/zips/stp.zip

> doesn't happen?

<Course in fundamental programming on> ;-)

Write your drawing routing such that it can be executed from the VBL queue. This avoids flicker as drawing is done during the flyback gap, and still does not exclude system calls if done properly. There is no requirement at all to *wait* for the VBL. Let the drawing be done *by* the VBL, and only do the game progress be done in the main program, but use an independent timing source. This way, even the effect mentioned by Hans of duplicated output is avoided.

Consider a jump'n-run game. Your little sprite is moved by joystick, mouse, whatever. The main program does a loop :

1) Watch the 200 Hz system variable until it has changed (increased by one). This means 5 ms have elapsed since this point was done last time.
2) Inquire about the state of the joystick.
3) Apply the state to some internal coordinates of your jump'n-run thing, but do not draw anything !
4) Handle all other stuff, like collisions, "gun fire" etc. etc. but make sure this is finished before the 5 ms time slice is over.
5) Go back to point 1).

Now hook a VBL routine into the VBL queue, that does the following :

a) Get last sprite position as saved by point e).
b) Undraw the sprite at position determined in point a).
c) Sample the new sprite coordinate from the internal variable mentioned in point 3).
d) Draw the sprite at position determined by point c).
e) Save the position determined by point c) into some internal variable.

With this scheme, all the game will always be of the same speed regardless of the video hardware, since point 1) ensures that each movement takes precisely 5 ms.

With this scheme, no flicker can happen, as all drawing is done in the VBL exclusively.

With this scheme, it cannot happen that any two successive "screens" show the same picture, as the screen is updated each 20 ms (ST-Low 50 Hz), 16 ms (ST-Low 60 Hz) or 14 ms (VGA/ST-High, 70 Hz), while a movement takes place each 5 ms, which gives at least two, or even more, movements before a "screen" refresh happens, therefore no "jerky animation".

<Course in fundamental programming off> ;-)

Of course this is pretty basic, and for a fully grown game a fair bit of other stuff is required, but I think it shows how a game can be constructed

that has all the discussed advantages, but does not suffer from the mentioned drawbacks.

> Yea, but if it works on the slowest machine, as my examples do, it is possible,
> as there isn't a machine not capable.

No there are machines "not capable", as speed will depend on either CPU power or video hardware. And as Tony has pointed out, even with the latter the speed variances can well be intolerable.

>> the box has plenty CPU power compared to most other Ataris, and since

It's my whole point that FPS is not an appropriate speed unit, as it is not constant but depends badly on hardware.

>> > Thats why an "enquire available modes" (as I suggested in another post) call

>
> But surely it is better than nothing? The VDI does not (currently) offer
> any equivelent...

It provides every information that is possible with the *current* resolution. In the context of multitasking (which is the very context that also leads to the desire of games running in a GEM window) this is all what is needed. v_opnwk() / v_opnvwk() both provide a fair bit of information on what is possible. vq_extnd() provides an additional lot.

>> > No, I think it should be the PROGRAMMERS choice. The environment that the

> significant portion of the games "market".

Do you really lack the imagination to find out yourself, why this is the
case ? It is because you guys have abandoned their hardware long ago. It
is because they've given up on the hope that games programmer might one
day become open minded enough to write the games such that they will run
on their hardware too, they simply don't bother anymore to ask each time
a new game comes out if it does run on their hardware too. But they are
there, and as every human being they like games too. Get into the business
of software that is not games (like networking in my case), and you'll see
how many people are there with hardware that does not support ST-Low anymore.
I'd bet you'd be surprised.

>> A user that wants it full-screen can still

>> Setscreen anymore."
>
> True, but that was with the release of the TT. In the Falcon, they extended the
> functionality of Setscreen. Why, if it wasn't supposed to be used anymore?

No, not for that purpose. It was just as said in official documents : To
enhance the likelyhood that old software will run on the new machine. For
nothing more it was extended.

>> My developing machine has 960x544 on an SM124, still I prefer to use a smaller

The latter is not possible, that's the difference. Think twice and you'll
see why.

Cheers Peter

There is one, see below.

>>--> Who knows a "legal" method for obtaining the current X-Y position of the
text
>>cursor?
>
> If you place a virtual vdi workstation into proper text mode

That's the proper way. Use VDI exclusively ! Enter alpha mode by calling
v_enter_cur(), then do a vq_curaddress() which returns the cursor's row
and column position. There is VDI functions for all moving and setting
cursors, erasing parts or whole screen, and outputting text (the latter
being faster than calling GEMDOS Cconws() or others !).

>>Incidentally, what is exactly the situation with LineA for '030 and up Atari
>>computers. I have heard inconsistent things on the subject.

The $a000 function (initialisation) is kept so that programs can find out
about system fonts, and can read the VDI escape variables which are docu-
mented for read access only by Atari in the S.A.L.A.D. document. All other
LineA functions are gone or about to go away.

Personally I'd discourage people from using the $a000 function too, but
definitely it's not wise to use any of the other LineA functions.

Cheers Peter

You can simply place an icon in a menu, in the same way that you would
place it in any other form. You may have problems when the icons are not
scaled for different font sizes etc. I guess it might not be a good idea
to put icons in menus at all.

Uhm, I don't follow you there. AFAICR, the AUTO-folder program is where
the DSP code is loaded from. How would you make it work without that?

>I wish I had had that documentation about a month ago!

It's always a good idea to ask on Usenet about these kinds of things.
MGIF has had support for using JPGD for a long (might well be two years
or more) time, and the sources for that are available. The code I use is
based on the reverse engineering which was done even earlier by another guy.

I *could* be really complicated now, and say yes, if you want it to be
the TITLE of the menu. (what appears when not selected. Inverted when
selected)

Here's how: (This theary tested using GFA BASIC only)

1) Make the menu pop up.
2) Make sure there's enough room to place the icon/string
3) Put the icon/string where you want it to go.
4) Let the user play!

Any colours will be inverted.

(BTW - you can see this in action in the next version of CDSdraw, out
next year)

There was a good article on Atari's history in one of the mainstream computer magazines a year or so ago that talked about that fact in more detail (sorry, I can't remember which magazine it was, but I probably still have a copy of it at the office somewhere if anyone's interested). From what I remember, Microsoft couldn't produce a Windows OS within the timeframe Atari required for introduction of the ST. Microsoft wanted a year or so for development, while GEM was essentially ready to go. And, at that time, the Tramiels were anxious to produce a new system to help revive the company they had just taken over and take it back from the ashes of its former glory.

Found it this time. Nice graphics actually. Will try next time I hook up
an ST to my TV set.

HTML is lousy however, you should work on it. With Netscape Gold, part of
the text is hardly readable.

Cheers Peter

If this is done from within a real TRAP handler (as opposed to via some
vectored routine) , it's quite possible to call the VDI. TOS's reentrancy
problems don't come into play then (you haven't yet entered TOS).

>and column position. There is VDI functions for all moving and setting
>cursors, erasing parts or whole screen, and outputting text (the latter
>being faster than calling GEMDOS Cconws() or others !).

Does anyone know of any programs that use those VDI routines?
(I'd like to have something to test fVDI with when I get around to
 implementing them.)

>The $a000 function (initialisation) is kept so that programs can find out
>about system fonts, and can read the VDI escape variables which are docu-
...
>Personally I'd discourage people from using the $a000 function too, but

That's indeed a good idea.

fVDI will not be able to support the lineA variables fully (among other
things, there will not necessarily be _one_ screen).
For compatibility, a call to $a000 is planned to set up a memory block
with much the same information (some may not be available), but those
values will not be updated as they would with standard lineA/VDI.
This means that if you want to access the current values (such as in the
program discussed in this thread), you can't rely on an address supplied
by an earlier $a000 call. You have to make a call before every read or
you may well read the same cursor coordinates over and over again.

Organization: Hamilton-Wentworth FreeNet
Newsgroups: comp.sys.atari.programmer

No doubt many of you Atari ST enthusiast remember the old Atari 2600 VCS. If you're like me it was probably the first video game system you ever had.

It may suprise some of you to know that there are still people out there who collect for and play these old machines and it may suprise some of you even more that there are people who actually write new programmes for this machine (even producing them on cartridges, of course they're Eprom based instead of Rom).

The easiest method to write new games for the Atari 2600 is to use the Starpath Supercharger. It's a device that plugged into the cartridge port of the Atari 2600 and then had a plug that went into a cassette deck.

Currently there are Atari 2600 development platforms on almost every computer except, ironically enough, the Atari computers.

You can find 2600 development tools for:

The C-64 (Playbin.prg - a programme that takes binary files and turns
them into audio for the Supercharger Tapes)

The Apple][(This was the machine used to originally develope Supercharger
games for the 2600. As with the C-64, the bulk of the work
is just done with whatever 6502 assembler you like. But with
the Apple][, no special programme was needed to save the

```
              programme to cassette tape since the Supercharger uses the
              same tape format as the Apple ][)

The Amiga (Distella - a programme that disassembles 2600 BINary files
           DASM - a 6502 assembler
           Make Wav - a programme that turns 2600 BINs into WAVs to
                      be played to the Supercharger
           Cheetah  - similar to Make Wav, but allows you to enter game
                      codes before playing.)

The Macintosh (Bin2tape - A programme that turns 2600 BINs into WAVs for
                          playing into the Supercharger)

The PC (Distella, DASM, Make Wav, Cheetah and
        Win PlayBin - a programme that turns 2600 BINs directly into
                      audio to be played into a Superchrager through
                      your sound card, or recorded onto cassette tape)
```

I've been using my PC to develope new games for the old Atari 2600 and have no complaints about the development system, but it just strikes me as odd that there isn't a development system for at least one Atari computer. The development tools for the 2600 are all public domain and the source codes for many of them are available on Bob Colbert's Atari 2600 programming webpage.

http://www.novia.net/~rcolbert/

Bob wrote or ported many of the PC and Amiga development tools. And is currently working on a visual 2600 development system for Windows 95.

Anyways, I was wondering if there happened to be any ambitious Atari ST programmers here who would also like to write games for the Atari 2600 (It's a 6507 processor, almost the same as a 6502. It's also an extremely challenging machine to write for) and would be interested in porting the development tools over to the Atari ST platform.

One of the biggest advantages the PC and Mac 2600 developers have is working Atari 2600 emulators on their machines. But a 2600 emulator would likely be beyond the capabilities of any of the atari machines.

If you're interested in learning to programme the Atari 2600 there are two mailing lists...

stella@biglist.com (an Atari 2600 only programming E-mail List)
gametech@rbkc.gov.uk (an E-mail list for programming all classic machines)

and two newsgroups

rec.games.video.classic
alt.atari.2600.programming (this is a new group)

I hope there are some Atari ST users/programmers out there who also have an interest in developing new games for the old Atari 2600.

CRACKERS
(Programming with no video memory from hell!!!!!!)

You have it too ! The standard desktop uses them for displaying a file's
contents. I'm not entirely sure if that desktop jumps via the trap #2,
or calls the ROM VDI internally. I'd guess the latter, but - who knows ?

Cheers Peter

Hello everyone,

I've have a game I wrote in STOS that is practically finished (I have 10% to go) except that my version on the compiler will not compile the Ninja Tracker code correctly. I was wondering if anyone (Tony?) who has the latest version of the compiler could send it to me?

When I'm finished with the game, I'm planning to release it as freeware (like I could get any money out of it anyway...) I just want to finish this thing which has been on my conscience for a long time (almost 2 years)!

Thanks,

Greg George

There was a Clever Hack in the past, in which you
placed the string as the menu entry, then edited
the entry, changing it from the "string" object to
an "icon" object.

I've forgotten the details, but maybe this will
trigger someone else's memory...!

Ah!
I never knew that, but I guess it makes sense.

Still, that would only test the text output routine and possibly the
full screen clear, right? There is a whole bunch of other routines I'd
like to test as well.

Just give me two minutes with my VDI profiler and I'll know. ;-)

If the destination screen is in the same colour mode, just another
resolution, there already is a VDI function that can do such a blit.
Just give it a properly set up MFBD and blit away.

I guess it would be useful to have more general support, though.

>machine run the Gem application. Make this "stos" Gem application

How does STOS switch screens as it is?

Couldn't you 'just' replace the switch call with a 'blit to GEM window' call?

>Heck. It *might* even allow 256 colour sprites without Tony having to
>write a line of code for them. All the host machine need do when it
>sees a 16 colour sprite is replace it with its 256 colour equivilent!

A simple blitting scheme like above would of course not handle that, but a replacement of the sprite routines could. There's not much difference between a 4 bit plane and an 8 bit plane blitting routine. For chunky screen modes blitting is incredibly simple, but then you need to convert all the sprites in advance.

>the flickering made me realise there was a dire need to write some

Sounds like something I'd be interested in for fVDI.

>I'm willing to post these routines if I can be convinced of the
>remaining 5% which would require me cobbling up a test program. Is

Perhaps you wouldn't need to do much extra work at all if those routines could be incorporated in an fVDI device driver.
What kind of routines are you talking about?

>someone prepared to prepare a resource file with a 256 colour icon in
>it? If so, make it thus ...

I've never done any colour icons (apart from adding/modifying a few in my desktop resource file), but I may be able to do it, if necessary.

Still, with a Nova card I don't belive that you will get a correct VBL.
With the
Falcon you even switch of the Videl to get extra performance (no point
with having
the Videl take clock cycles to update a screen which doesn't even exist)
and I
would belive that it's the Videl which handles the VBL on a Falcon. The
same would
apply ot a ST or TT with a gfx card. Maybe I'm wrong but I don't think
so.

Yes, this is exactly what I am doing! The only thing done from within the bios
handler is just reading cursor position into the Line-A array.

Peter Rottengatter:
>The $a000 function (initialisation) is kept so that programs can find out

>LineA functions are gone or about to go away.
Well, very interesting. I do have a developer's doc bought in 93 (I think), but I don't remember that document. Anyway I will stick to that and keep my program unchanged...
(BTW, sorry Peter, the rest of your message about vq_curraddress() was killed by my 2nd message telling why I can't use that call).

Johan Klockars:
>If this is done from within a real TRAP handler (as opposed to via some

Sorry, you cannot speak of "TOS reentrancy". BIOS and XBIOS are reentrant up to 3 levels (to some extent, but I don't want to elaborate on this here), provided that you operate in a manner documented by Atari (the reentrancy is not automatically handled!). GEMDOS and AES are not reentrant, and probably not VDI as well.
Anyway, in my case, I am not directly inside a VDI trap handler, but inside a BIOS handler. However, the BIOS was called by the VDI... I won't dare making a VDI call from there.

>fVDI will not be able to support the lineA variables fully (among other
>things, there will not necessarily be _one_ screen).
Perhaps you could provide an array of Line-A structures, one for each screen, the 1st one being the 'main' screen. This would provide some sort of compatibility, if what I am saying makes sense (?).
>For compatibility, a call to $a000 is planned to set up a memory block
>with much the same information
Yes, I think this is really needed, many programs use $A000.
>but those values will not be updated as they would with standard lineA/VDI.
Why not?
>you can't rely on an address supplied by an earlier $a000 call.
Why again? Forgive my ignorance about fVDI internals, but I don't see the necessity to change that address once it has been set up.

>>contents. I'm not entirely sure if that desktop jumps via the trap #2,
>>or calls the ROM VDI internally. I'd guess the latter, but - who knows ?

My guess is that the desktop uses a regular VDI call, otherwise desktop windows will not show up properly with graphics cards.

Thanks a lot to all of you who answered.

>Sorry, you cannot speak of "TOS reentrancy". BIOS and XBIOS are reentrant

TOS has reentrancy problems, which is what I said. I didn't specify any
specific part of TOS, since I've never checked if some might actually be
written in a reasonable way.

>up to 3 levels (to some extent, but I don't want to elaborate on this here),
>provided that you operate in a manner documented by Atari (the reentrancy

I've seen TOS use three separate stacks. I'd _really_ like to know why
anyone thought that was a good idea.

>is not automatically handled!). GEMDOS and AES are not reentrant, and probably
>not VDI as well.

If they have written the VDI in any kind of sensible way, it would be quite
safe to use the query functions from inside any other part of TOS.
I'm not saying they did, though. The TOS TRAP dispatchers can make you weep.

In fVDI or NVDI I can't think of any reason to worry about it. AFAIK, neither
writes anything in their internal structures at such calls and they don't
set up any new stacks.

Perhaps we should check out all the usual VDIs and 'retro document' that
it's safe? Anything to get rid of those nasty lineA calls!

>Anyway, in my case, I am not directly inside a VDI trap handler, but inside
>a BIOS handler. However, the BIOS was called by the VDI... I won't dare making
>a VDI call from there.

I can quite understand that (even if I'd be surprised if there was a
problem with the cursor position call under NVDI or fVDI).
How about if I guarantee that it will be safe under fVDI? Then you could
special case that and all will be well. ;-)

Why would the VDI want to call the BIOS, by the way. That doesn't sound very reasonable to me. Keyboard I/O?

>Perhaps you could provide an array of Line-A structures, one for each screen,
>the 1st one being the 'main' screen. This would provide some sort of
>compatibility, if what I am saying makes sense (?).

I've not yet decided on how to do this. The main problem is that you don't know _which_ screen an application is interested in when it does that $a000.

>>For compatibility, a call to $a000 is planned to set up a memory block
>>with much the same information
>Yes, I think this is really needed, many programs use $A000.

Even the current version of fVDI itself. ;-)

I wonder what lineA variables are commonly used?
Screen size and graphics mode are probably common, but I doubt the cursor coordinates interest many. Anything else?

>>but those values will not be updated as they would with standard lineA/VDI.
>Why not?

Take your cursor coordinate thing as an example. There would be a separate set of such coordinates for every physical screen workstation, while $a000 can't ask for a specific one.

I guess I _could_ update some of the variables, but there's still no way to make sure the $a000 call gets access to the values for the screen the application was really interested in.

>>you can't rely on an address supplied by an earlier $a000 call.
>Why again? Forgive my ignorance about fVDI internals, but I don't see
>the necessity to change that address once it has been set up.

With current VDIs there is indeed no need. If I do what I plan with fVDI, however, the lineA variables in question don't really exist. The $a000 call will just set up a table of some, hopefully, adequate numbers. Half a second later those numbers may be totally wrong, since the screen they referred to may no longer exist.

If there is a good solution to all this, I really want to know about it. It would be a pity to break applications only because they use a few lineA variables.

>My guess is that the desktop uses a regular VDI call, otherwise desktop windows
>will not show up properly with graphics cards.

The desktop certainly uses TRAP #2 for normal VDI calls (otherwise VDI replacements wouldn't be able to display anything). The question was if the text 'browser' did too, which seems likely.

```

It only stands to reason that where there's sacrifice, there's someone collecting the sacrificial offerings. Where there's service, there is someone being served. Make no mistake about it, the man who speaks to you of sacrifice is speaking of slaves and masters - and he intends to be the master.

The old VGA standard is 60Hz (Even the Matrox millenium starts
by default in a 60Hz mode). The Falcon right out of the box will
produce a 60Hz VGA (AFAIK). You can change the refresh rate on
a Falcon to almost any value you like.

Most PC graphics card do have something like a vsync indicator. I
don't know wether it can be used to generate an interrupt. There
has to be something like the VBL interrupt for the OS to work.

Well, you shoud have a look at
http://grelb.src.gla.ac.uk:8000/~mjames/computers/atari/
"The dark side of the spoon" is available overthere too. You
will be suprised what you ST can do.
Some other good ones are:
"Flippo demo", "Ooh Crickey, Wot A Scorcher!" and
"Synergy mega demo".

I consider a demo like a pice of artwork. Suppose you
don't like art either.

Hi

Saw the replies and noted no mention of "Edhack" which can be both an
accessory and Program. Good old Word Writer St, St Writer, St writer Elete
1ST Word & 1ST Word +

Though Pagestream is great; as a word processor it is clumsy, as is
WordUP, Calamus etc (there are others) these are for desktop publishing

Word Writer has both Dictionary & Thesaurus capability is O L D came out
when the 1st ST's did but for simplistic writing is fine.

Has anyone checked with Toad to see if they have something good.

Edhack is by far the nicest little editor/word processor

Johan Klockars:
>Why would the VDI want to call the BIOS, by the way. That doesn't sound
>very reasonable to me.
Well, I am not sure. It is apparently the case with Nova VDI, when that VDI outputs text in _alphanumeric_ mode.

>If I do what I plan with fVDI,
>however, the lineA variables in question don't really exist. The $a000
>call will just set up a table of some, hopefully, adequate numbers.
Yes, this is the correct thing to do.

>Half a second later those numbers may be totally wrong, since the screen
>they referred to may no longer exist.
>If there is a good solution to all this, I really want to know about it.
>It would be a pity to break applications only because they use a few
>lineA variables.
Here is what I propose.
 - For 'old' applications, we speak here only of applications reading values. Those writing values, in view of a $A00x call, x!=0, cannot be supported anyway.
 - Set up at boot time an array of Line-A structures.
 - Don't modify the address of that array later on, and make its address public with the $A000 call.
 - Each structure in the array will correspond to a given physical screen. Since there is a unique VDI handle for a given physical screen, there will be a de facto one-to-one correspondance between VDI handles and structure indexes. Provide a call to obtain the index corresponding to a handle.
 - An application aware of this mechanism knows which screens it has opened, thus will know which indexes correspond to these screens. The application can therefore access to the correct structures inside the array returned by $A000, and only these ones.
 - If you keep at index 0 the main screen, i.e. the one on which the desktop runs, an old application launched from the desktop will access the correct Line-A structure, without even knowing that there are others...

A final remark. The Line-A structure contains a read area, the one we are dealing with here, and a write area for parameter passing. Normally, preserving only the read area would be sufficient. However, I would suggest to keep also the write area in place. That way, any unsupported old program can write its garbage there. The program will not work, but perhaps not crash the system.

What do you think?

Cheers.

>Pure C did as good a job itself.
```

Out of interest, how does it cope with this sort if situation?

```
main()
{register int i,j;
 register blah a[][],b[][]; /* whatever */

 for (j = 0; j < jj; j += 1)     {
```

```
     for (i = 0; i < ii; i += 1) {
          a[i][j] = b[i][j]
          foo();
     }
 }
}

foo()
{
 /* whatever */
}
```

I'm thinking of what PureC does with the register variables when it has to call foo()?

Mwc promptly stacks all the stuff it has in registers at foo() then unstacks them when foo() returns, causing more overhead than if there were no register variables used in the first place.

I read somewhere that modern compilers tend to ignore all the programmer's register variable declarations because, as you said, they can do better.

>Just remember that arrays,
>structures and unions will always be treated as volatile.

I take it that is part of the definition of C? I was aware that Mwc does this but never thought about it in its wider context.

>so, how?

That would depend entirely on the AES being used. If you're thinking what I think you are thinking then no. The structure of a menu is quite rigid and there is no requirement for it to support anything but G_TITLE, G_STRING and G_BOX (iirc). This in itself might not be the problem however. You could well find (and I suspect you would) that all AES happen to use objc_draw() say, to implement the menu and thus be capable of drawing any object type. The problem I'm thinking of is the depth that it makes its objc_draw calls to might cause parts of the menu never to be drawn. Example ...

Standard drop down menu consists of a G_BOX which is completely covered by G_STRING objects. If you were to cover the G_BOX with (say) a G_IBOX for each G_STRING then have each G_IBOX posess a G_STRING and a G_ICON as children of each respective G_IBOX then you could well find the aes only draws the drop down G_BOX plus all the G_IBOX's without their children. So you would never see the drop down contents.

Looking at it from another angle, you could make do with the G_STRING objects as per normal but widen the underlying G_BOX to make space for your G_ICON objects. You could then link in each G_ICON as a sibling to its respective G_STRING (iyswim). This would make no changes to the depth and would stand the bext chance of getting drawn. The disadvantage would be that the icon and the text would return two distinct values whereas the first method (if it worked) *might* return a single index (the underlying G_IBOX) and if you were amazingly lucky, might even do this with all Aes's. Certainly worth checking.

A third method would be to use a font which contains the desired icons as characters.

But what happens when MagiC changes context to another application
which posesses a menubar? ;-)

You see, MagiC has to keep track of all the different menubars and
draws the menubar which belongs to whatever application has just
become the foreground application. Thus, when MagiC redraws the
menubar for your application the icon/text you placed there yourself
will vanish - it must be part of the menubar! <G>

Many of the books written for C programmers do in fact possess
assembler bindings for making the calls. The Compendium for instance.

It should work with STOS. I assume it writes directly to the screen
thus the vdi should have no trouble in this respect as it would be low
medium or high rez.

Anthony will have to answer this although I suspect all it does is
fiddle with the physical screen base.

>Couldn't you 'just' replace the switch call with a 'blit to GEM window'

>need to convert all the sprites in advance.

Yes. I made the assumption that the 16 colour sprites would be
ordered/named in some way so that 256 colour ones could be substituted
for the 16 colour ones - I just forgot to mention it! :-)

>>the flickering made me realise there was a dire need to write some

There's not that much to them - except it took an age to figure out
what parameters went where. I had no vdi docs to speak of at the time.
Not many now!

>>I'm willing to post these routines if I can be convinced of the

>Perhaps you wouldn't need to do much extra work at all if those routines
>could be incorporated in an fVDI device driver.
>What kind of routines are you talking about?

Nothing more complex than vro_cpyfm() in various easy to call
disguises. They came about from wanting to drag my own custom built
windows around. There's the usual one to copy a rectangle from one
place on the screen to another. Then I built one to grab an image off
the screen into memory (which can allocate the memory as well),
another to blit it back to the screen.

Like I said, the flickering that was associated with restoring a
complete window whilst dragging it annoyed me. This is where we come
to the useful routines as far as our vdi animation purposes are
concerned. They treat the offscreen image as a screen (the same size

as the "grabbed" image) in its own right which allows portions of the screen to transferred to/from portions of the offscreen image. Thus moving a window around in real time became a job of saving the portion which was about to be covered, copying the onscreen image to its new position, then restoring the little bit of background that had been uncovered by this action.

>>someone prepared to prepare a resource file with a 256 colour icon in
>>it? If so, make it thus ...
>
>I've never done any colour icons (apart from adding/modifying a few in my
>desktop resource file), but I may be able to do it, if necessary.

It doesn't matter now. I've put together a little test program (using the above routines) which I've posted in a separate thread. Rather than an icon, it just draws a red box with v_bar() then animates that. If the test program doesn't get any reports of glitches on exotic machines then I'd be happy to dig out the sources for them. You'd probably understand the source code better than me!!

It did still say 0.20 but I just assumed you'd forgotten to update the
html. Odd though if you hadn't updated it because it beahved
differently to the last one I downloaded.

One of those "strange" occurrences it is best not to dwell on for too
long I suppose!

I've only one more idea. Hook into the <esc>Y cursor move sequence
then follow the driver code until you locate where the Nova driver
stores its cursor position information. Ordinarily this would be a
very bad idea but in the case of a patch like this it is quite

acceptable imo.

I guess so, but with MagiC I noticed a funny thing when using Geirs
Videl shutdown program.I'm not sure what this does but, but if I did not
have the VGA adapter plugged into my original Falcon video port I could
not move my mouse! I do believe that this had to do with a missing VBL.
Could the mouse get updated by the VBL under MagiC?

If this is the case I guess you don't get any sensible VBL from the Nova
card but you have to relay on the VBL produced by the Videl which will
not be correct. The same must go for a TT and ST with graphics card.

It should say 0.21 on the webpage and be something like 48kb (the old was 43kb) when zipped. I still can't see what happens. Do you still get that dialogbox about the soundsystem being locked??? You should not get that at all now, if you computer
doesn't report it self as a Falcon....

I will look at it, but I can't promiss when...

: BVR? I can't think offhand what this means but I guess it means
: "luminance, saturation and hue" iyswim?

No, 'V' simply stands for "Vert", which is French for "Green", so
should actually be 'G' in English. You'd get BGR, which is RGB in
Intel-mode. Had to read a lot of French or French-English translated
in the past. :-)

I'm curious though, would the 2 pixel per byte 4 bp mode register as
a Non-atari bitplane mode? (when inquired from the VDI)

: >then,all the rest is easy,the only thing

: I might but then again I might not. I understand the relationship for
: 16 colours and less, but have no idea one way or the other if it holds
: true for 256 colours.

There should be an NVDI call for this, IIRC. There is also a somewhat more
primitive method. It was discussed in a thread last year...

: Thanks for the offer but it was the desire to avoid going into this
: sort of detail that prompted me to request a resource file. <G>

If I remember well, it's a trouble with self modifying code. There is a
version

of the Atomic packer that works fine on Falcon. I do not remember wich one.

> 200 Hz interrupt runs far more precise than is required.

Sorry, but this just shows your ignorance of games programming. Games
are usually
"tied" to a VBL so that artifacts are not created by allowing screen-redraw
of data while it is still being written to by the game engine...

> If just a defined delay is required, one could also simply access the 200 Hz
> counter, for which one does not need to install interrupt handlers.

Yea, and then you get some great effects with redrawing the screen while the
play watches...

> > Also, in general, the higher the resolution, the slower the machine gets. So,

~~~~~~~~~

> lution, and the player should switch resolution in order to enhance speed.

Maybe, but it is up to the programmer to make sure the game is playable, and runs as intended - which includes the speed that it runs.

> I should add : There is no point in refusing to run a game in 1024x800 on any
> Atari, because you cannot know if the player has miraculously sped up the

Yea, and that is done infinately quick, and so doesn't take any time?

> So making such assumptions is bad programming style. I'm not saying that your
> style is bad, but your statement above might mislead some other programmers
> to using such style, which should be avoided.

Hehehe.... yea, right. :-)

Maybe it isn't good programming style, with regards to portability, but making it so generic/flexible that it doesn't run properly on slower machines, and not being able to say whether a given machine is good enough is equally bad style when it comes to games...

eg. Say I wrote a (generic, any-machine) doom game that runs fine on a Falcon, but runs at FPS. Should I say "for all Ataris"? I dont think so.

> > It was their failure to provide a generic call in the ST that has caused this
> > problem.

Thats why an "enquire available modes" (as I suggested in another post) call is a good idea, IMO.

> I've been told it's in NVDI V4. I don't have V4, just V3.02, and that's why
> I said AFAIK. I gotta ask others for this.

Somebody, please speak up...

> > If I want to play an arcade game, I dont want it running in a small window
> > in the top-left corner of the screen (or whatever), I want it full-screen
> > no distractions.
>
> That should be the user's choice, don't you think so ? Or are you thinking

No, I think it should be the PROGRAMMERS choice. The environment that the
game uses, what it looks like, and the options available to the gamer should
all (IMO) be controlled by the programmer, and not the user.

> everybody else will think the same way as you do ?

No, but it should be up to the programmer, not to the user, IMO.

> > Find my someone who likes playing Quake no the PC in a window
> > - you certainly wont find many who dont play full-screen.
>
> Because they can't. I'm sure I'd find some who would if it were possible.

Sorry, but you clearly haven't hit <CNTL>-Enter in Quake (or Quake2, or
even Heretic and other games of its age) as DOES work. [3dfx users can
only have full-screen mode due to limitations of their hardware, unless
they install WGlide, which is a third party driver]

It should probably be pointed out that it is significantly slower...

> > Equally, its hassle for me as a user to be TOLD to change resolution by

>
> If you "know" that, then - sorry - you're entirely wrong on this. No program
> can be sure if it will be capable of switching resolutions properly by it's
> own.

"as a user".

ie. If I run a game from 640x480x4bit on my Falcon, and the game needs a 16bpp
mode, I *know* that it is possible for the program to change into
this resolution
cleanly on my machine, using documented OS calls. I would be rather pissed
if it came up with a dialogue saying "Sorry, I refuse to change into 16bpp,
do it yourself".

> > This seems a very strange way of doing it... IMO not what the games-playing
> > public want.
>
> Because they aren't aware of the situation. But you, as a programmer, are,

Maybe... but in my experience, nobody reads the documentation anyway :-)
[I know I dont...]

> The user is not in the situation of dictating what

> is possible - if he were then I'd ask my hardware to support 3000x2000
> True-Color modes ;-)

Yea, but you want everything. :)

> Some improvements can be done by using hacks (this is
> what I call fiddling with hardware to set video modes), but it leads to
> the situation that few users can use the program. I know, people don't care

So what do you call using documented OS calls?

As for compatibility, shouldn't gfx cards be changing the _VDO cookie to show
that they cannot cope with the facilities of the machine? This is surely
what atari intended this for...

> if their favourite program works on their neighbors machine, but I do not
> think this is something that should be encouraged. People should be made
> understand that the little hassle (if it's needed in the first place) is
> essential in order to let others have fun too with that program.

Yea, point taken... but again, if it causes problems on the low end machines,
its a decision that must be made by the programmer on a game by game basis.

> > But then, would anyone actually try and PLAY that many games at once? The
>
> Depends on the type of games. I'm not a fanatic of arcade games, and as such,
> the type of game I usually prefer is that of which several ones can be played

Yea, but do you ever really try and play solitare, patience, landmine etc.
all at once? You must have a really good ability to concentrate on many things
at once. :-)

> > answer is of course no, you would only want to play one game at a time,
>
> There is an often made mistake. People tend to think their own opinion
> would hold for the whole world.

Yea... maybe it is a silly assumption to think that people only want to
play one game at once, but then maybe its silly to assume people are
sensible...

> So please accept that for this reason the line of yours that I quoted above
> is rubbish, especially the "of course".

Yea, the "of course" maybe was a little over the top, but I am supprised
that people actually try to play > 1 game at a time...

> > so why have it only taking up 1/9th of your screen, with the rest displaying
> > the desktop?
>
> There are more reasons for one or the other than you can remotely guess.
> Therefore it's pretty arrogant to dismiss half of them, by denying existence

> of reasons to restrict a game to only 1/9th of the screen.

Yea, but if you are just interested in playing the game (do you accept that
this should be the primary purpose of a game?) then you usually dont want
to strain your eyes...

> >> > requires ST compatible resolutions, but that isn't the programs support -
if

> >> > for the ST not to work.
>
> There are programming techniques that make such expectations obsolete. It
> CAN be done, games that run on all machines. So there is no reason to expect

Yea, by limiting the functionality available to the programmer. For a start,
the STe/TT/Falcon's hardware scrolling cannot be used.

> such a thing. The current situation merely makes me *suspect* that a given
> game won't run, and as it can be done, I'd be happy if this could be changed.
> Currently it's sadly prevented by certain people simply refusing to try other
> techniques, techniques that in some cases even save work.

It certainly wouldn't save tony any work, as he would have to write a bunch
of new sprite routines, not to mention learn a new language (or wait for
someone to finish GEMMA).

> >> Why design such games in the first place ? The Atari world is a lot bigger

>
> Sorry but this is rubbish, especially the "if not all" in your sentence.
> If it holded then there were no other models, and the discussion had never
> started in the first place.

Sorry, I didn't write what I meant too say.... I was quoting from your sentence
"such that they run on most if not all models". "most" implies that there
are some which it may not work, which (probably) means the low end ST, which
is what Tony (and others) is (are) developing on.

> You might be judging from the situation in the UK, maybe the "most" is true
> there,

I have no idea. I only know one other local Atari owner (Falcon).

> Agreed. But it doesn't help. A system that does not provide any ST video
> mode may still make Setscreen behave is if ST-Low is used (or were present).

I wonder how many programs there are? I have an idea, and will report back
here in a few days (hopefully) with results...

> > Oh, I'm not the one advocating that you change the way you program... thats

>
> Oh, I'm not telling him to do so. I'm merely trying to convince him to just
> *try* once to program using GEM methods. The experience might let him use

Erm, so whats the difference? you are trying to convince him to change,
aren't you?

> it for programs that do not require super-fast scrolling on small machines.
> If he only does that then I'm happy ;-)

Hehehe...

Unfortunately, as has already been pointed out (quite a while ago... probably
around message 20-50), STOS doesn't provide access to GEM in a compiled
environment (the GEMMA extension provides it in the interpreter, but the
compiler code isn't finished. Source code is available though), and Tony
doesn't know C.

> > If Hades/Medusa/Milan owners want games that make use of their systems,

> > people with a bottom of the range ST to write them...
>
> All what I'm saying is that there are many types of games that can be
> developed on a basic off-the-shelf 8 MHz ST to run even on the fasted
> machines in a sensible and enjoyable way.

"many". so you recognise that for some software this isn't possible
in this environment? In particular, this software is (IMO) a large chunk
of the topic of this thread... Heartland, Diamond Ice, Billy Boy...

> It merely needs a little
> discipline and use of standardized methods to achieve this.

And a significant amount of work from myself/Paul Jones/anyone else to
make GEMMA a reality for compiled software, for this to be practical
under STOS.

[btw, I have no intention of doing any more code on GEMMA, having written
 90% of the interpreted code... I believe Paul has also stopped.]

Many ST games cannot even be run from Desktop because of the extra memory requirements imposed by GEM...

Yes, and IIRC, he said it was pretty fast on his Falcon ("fast" is a relative term, so who knows...)

[blush]

I dunno what possesed me to write the above paragraph. Well, I do
actually. Too much "amber nectar" ;-)

I'm not pretending to know anything about the Falcon specific screen
modes but truecolour isn't 256 colours is it? Besides, if 256 colour
icons do not display properly in truecolour then that is a falcon
problem surely?

>if you want to know the structure of video
>memories on different machines/cards it's
>not difficult,there is Atari and Non-atari,

BVR? I can't think offhand what this means but I guess it means

"luminance, saturation and hue" iyswim?

>then,all the rest is easy,the only thing
>to really take care is the palette order,
>but everyone knows how to translate
>Vdi index into Hard index, don't you ??

I might but then again I might not. I understand the relationship for 16 colours and less, but have no idea one way or the other if it holds true for 256 colours.

>if you want more , just mail me ;-)

Thanks for the offer but it was the desire to avoid going into this sort of detail that prompted me to request a resource file. <G>

As it happens, no-one has obliged by sending me one so it looks like people are more interested in debating the subject than actually doing anything about it!

>isn't 100% Magic-compliant :)

iirc (and its been a long while) it goes like this ...

mask in BACKDROP (from magx.h) when you create the window (but see below).

```
#define  BACKDROP  0x2000
eg
KIND =(NAME | CLOSER | BACKDROP)
wind_create(KIND...)
```

so now MagiC lets your app deal with the message, which you would simply ignore. If you did want to handle it then you're looking at two messages which are WM_M_BDROPPED (from magx.h) and WM_BOTTOM (from wherever your aes messages are)

```
#define  WM_M_BDROPPED 100
#define  WM_BOTTOM 33
```

Version 3 upward (iirc) use the normal WM_BOTTOM message but lower versions use the KAOS WM_M_BDROPPED value. It doesn't matter which version uses what if you implement both which is nothing more complex than

```
switch (message_number) {
     /* blah */
     case WM_M_BDROPPED:
     case WM_BOTTOM:
     Handle_Bottomed(); /* possibly do nothing */
     break;

     default:
     break;
}
```

What I'm not sure about is, if MagiC versions >2 automatically bottom the windows or not, or if it is limited to versions less than 3 (ie the ones sending WM_M_BDROPPED) only. It doesn't really matter. If you implement the above you have all situations covered.

The only caveat, is when I glanced in the pug code I find that I specifically check if MagiC is present before masking BACKDROP into "KIND" which leads to a slight worry - that BACKDROP is not associated with the "bottom" gadget at all, but that it is associated with allowing a background window to receive mouse clicks without bringing it to the top. This has slipped my mind 'til just now.

Unfortunately, as there are no english docs (and I don't even have the MagiC2 manual to hand) I am unable to give a definitive answer. :-(

The worst case scenario with the above solution is that you will be implementing code which is not required for your purposes (ie you're keeping the window on top). Even though you have enabled background messages (MU_BUTTON) this will be irrelevent because you won't be allowing the window to be put into the background, or if you do, the game will be informed of the fact and act appropriately.

Sorry about waffling so much!

Yes. The MWC lexicon uses the term "programmer" throughout
specifically in reguard to (me) the programmer so it is an
understandable mistake!

>They've meant their own programmers of course, programmers of the AES.

Yep, I've known that since flinny first tried to "16 colourise" the
resource file for the original www installer 2 or 3 years ago. I'm
ordinarily very quick on fixing bugs but not with this one!!!

I think we have had enough fun at his expense, so to answer his question...

What you have is most likely Microsoft WRITE, not WORD. Microsoft dropped
support for this product within a year of introducing it. They reasoned that
if the
Atari users were not willing to support Microsoft they would not support
Atari.
This was the result of really bad reviews of the software, and a general
bashing
of the product by those that claimed to have purchased it.

I have not seen a copy of this in years. You would do much better by
getting
yourself a copy of WordUp.

Brian

I agree. I've used quite similar to good effect myself. It beats
declaring 'a' as a register variable by a large margin (on Mwc at
least). Actually I do both because Mwc has no register optimisation
schemes of its own. This is quite good in a way because when I do need
to use registers I know it is not going to screw it up for me behind
the scenes!

Aha, that is 8 * 27 = 216 screens, thats indeed a mile off 30 screens ;-)
That's more than seven times as much. True, there is probably only about
a dozen sets of hardware being able to do that in the world.

But, wait a moment. Take a PC mainboard well fitted with PCI slots, then
stick seven high-end graphics cards like the Millennium into it, let each
have it's own monitor, and put all the monitors in a row - Now ? :-))

To be serious again, it entirely depends on the complexity of those screens
if they all fit onto one disk.

Cheers Peter

Can you read ?? Nowhere I mentioned any resolution above 2000. I said
1600x1200 is required, which is 30 times the area of a 320x200 screen,
which is what Tony stated for Heartland. Any my Millenium is absolutely
capable of displaying that, it can do even more !

> (Ok, don't know the specs by
> head, could also be 3000 or even 4000, but I think it was 2000), so

You can be very sure that I know pretty well what my hardware is capable
of !

Cheers Peter

Hmm, seems that what I'm saying all the time. And even for the most
demanding games (scrolling etc) let it execute by some high clocked
68040 or '060 and you'll even have speed.

Tony:

> You already qualify, because you are the ONLY person in this

Sounds as if one has to release a game before you'd acknowledge that
it makes sense what one says. Simple logical argueing is not enough.
:-(

Cheers Peter

Hi,
there is no easy way to add a menu in a window. Most of customized
Gem libraries supportes this feature, and my own Gem lib too.
You can uses it because the source are included in the distrib.
My version works with all TOS.

Looks at:
 http://www-air.inria.fr/People/bereziat/windom.html

 Yes and no, I learn a lot from these postings, I would never deny
that, But if we get to a stale mate where one side believes one thing
and the other side believes another... then the deciding factor has to
be the actual proof, It certainly is not a case of me ignoring
everything said because there is no proof, thats unfair.. only when we
reach a stalemate.....

 Look at it in black and white for a moment,

I make lots of arcade style games.
AFAIK? You have made none.

I say this is the correct way.
You say that is the correct way.

I can show you the results of my argument.
You can only talk.

Thus yes you are correct the deciding factor would have to be the actual proof, I have learnt over the years of game making that a lot of things look very nice on paper, but when it comes down to implimenting them.. thats another story. I am sure you have come accross this in your line of programming so you understand my meaning..

I have no personal reason for not wanting to make Falcon enhanced games, I have made every effort to support machines I do not own, thus if I could go a step furthur then surely I would, I just do not believe it is possible to make "Enhanced" games for higher spec machines... on an STe..... Because even if all your suggestion work.... I can NOT test them... and even the people advocating that testing is not needed have inadvertantly proved beyound doubt that I am right and testing is neaded :)

Hey! perot@suse.modem.stud.uni-hannover.de (Peter Rottengatter) wasn't
it Tue, 3 Mar 1998 08:15:20 GMT that you wrote:

>> Sorry Peter as above, I was a mile off....27 screens by 8 screens, on
>> a One meg FM from floppy..... hehehe
>
>Aha, that is 8 * 27 = 216 screens, thats indeed a mile off 30 screens ;-)

 Yup sorry..In my defence this was a couple of years ago and I have
made 3 major games, one updated game and a couple of utilities since
then....Plus two games and two utilities on the go at the moment.I
just recall it being big..

>That's more than seven times as much. True, there is probably only about
>a dozen sets of hardware being able to do that in the world.

I may be missing something.. but even if it where 30...or 20 screens
and you could display them.. you wouldn't be able to see the detail
needed to complete the game in the puzzle type one at least...

>To be serious again, it entirely depends on the complexity of those screens
>if they all fit onto one disk.

hmm you won't find any screens on disk (I said the play area is the
equivelant of)... and had it not verged on the rediculous then I could
have doubled the size or even tripled and it still worked on one meg
fm and one floppy, and before you ask... all reviews made a special
mention of the excellent graphics and background scenery of the
maps...I can assure you that none of the 216 screen where repeated..or
randomly generated,

OK you have not seen my games..But you maybe have seen Sonic the
hedgehog?, well thats a big play area... but investigate the graphics,
all areas are different... but investigate more and you will see that
its the same set of graphics throughout the game but placed
differently like a Jigsaw, Thats the concept used in my games, I have
a set of background graphics and place them on screen where and when
needed.........this is why I mention the reviews saying the background
where good, I dont want you thinking they would be boring and repeated
:)

All the peices of the jigsaw are 16x16 and preshifted, every screen
update we have to know what every block has to be and place it on the
screen, this is yet more work for the game that people do not know
about..

If you havn't learnt anything from the above, then I am sure someone
reading must....

OK you cant or wont try the games...but there are plenty of colour
screen shots of them on my web pages that would give you a better idea

?..I wish you would take the time to at least look :)
.

..and MagiC's and N.AES and probably all versions of TOS, not only TOS 4.04. I have been told that version 5.2 of MagiC has this fixed, but what does that help me when I still havn't got my MagiC update!!!!

I guess I have to order MagiC 6, when it's available, directly from ASH.

I have looked through the documentation which you cand find on the net
for NVDI
4.1 (both the english and german release) and I can't find anything
about this
anywhere and these docs are listing all the VDI calls available from
NVDI 1 and up.
So Peter is apperently talking about something he hasn't to a clue
about. I don't
think such call exist, if it does, please tell us, as I can't find
anything about
this.

I use Pure C (which also optimizes the FPU registers). I can always check the register usage using the debugger (which can show you the assembler translation for each line of C code).

I used to declare register variables all the time, but I found that Pure C did as good a job itself. Just remember that arrays, structures and unions will always be treated as volatile.

Thank you, but this merely shows your limited understanding of what I said.

> Games
> are usually
> "tied" to a VBL so that artifacts are not created by allowing screen-redraw
> of data while it is still being written to by the game engine...

This is an entirely different issue. Avoiding flicker is one thing, timing is another one. At first they've got nothing to do with each other. I have nowhere said that all the game should run in the 200 Hz interrupt. I only said that timing should be done there.

True, a lazy programmer combines them completely, accepting the drawback of the game running at different speed on different video hardware. Heck, even the same video hardware can run at two different speeds ! I can make ST-Low work with 50 Hz and with 60 Hz. Already this should be reason enough to do timing not in the VBL, but choose an independent source. Your statements above only shows your ignorance of this, actually pretty basic, issue, which is a big one for sophisticated programming.

>> If just a defined delay is required, one could also simply access the 200 Hz
>> counter, for which one does not need to install interrupt handlers.
>
> Yea, and then you get some great effects with redrawing the screen while the

If you do it such that those effects remain that you should perhaps take a course in programming ! This is pretty fundamental stuff.

>> lution, and the player should switch resolution in order to enhance speed.
>
> Maybe, but it is up to the programmer to make sure the game is playable, and
> runs as intended - which includes the speed that it runs.

Ok, but it involves doing a couple of timing loops at the beginning of the game, using a proper reference like the 200 Hz clock, to find out. But I doubt that you'd be ready to spend that effort. Still this judgement by the code is unreliable, as data access to other RAM areas might be of different speed (Fast-RAM compared to ST-RAM) etc.

>> Then I should add, there are machines out there where CPU speed is not
>> affected by screen resolution, because all the graphics work is handled by

>> a graphics coprocessor.
>
> Yea, and that is done infinately quick, and so doesn't take any time?

No but that's not the point. The point is you can't tell unless you do
extensive timing measurement like I said above.

>> So making such assumptions is bad programming style. I'm not saying that your

> bad style when it comes to games...

I'm saying the latter holds for all software, so adopting this definition,
all software is badly programmed. Software *simply isn't* able to tell if
it will run fast enough. This is mainly for machine dependencies.

Being consequent, and accepting this, means that games should be designed
such that it's timing won't vary significantly amongst machines. This can
only be achieved by using a fixed reference, like the 200 Hz timer. This
does not necessarily slow down the games significantly, if done properly,
but it ensures that the game is playable not only on the machine it was
designed for, but all machines, provided there is enough CPU power. So
your example of the TT's VGA with 70 Hz does not cause problems anymore,
the box has plenty CPU power compared to most other Ataris, and since
timing is not derived from VBL but the fixed 200 Hz clock, the games works
with the same speed as on a small ST.

> eg. Say I wrote a (generic, any-machine) doom game that runs fine on a Falcon,
> but runs at FPS. Should I say "for all Ataris"? I dont think so.

What's FPS ?

>> settings. So on some hardware 800x600 will exist, but no 1024x800, then
>> other hardware might support the latter but not the former. This is why it's
>> important that software is able to adapt.
>
> Thats why an "enquire available modes" (as I suggested in another post) call
> is a good idea, IMO.

Definitely agreed. But a method like the one provided by Setscreen is trash,
as minor changes to a mode would require another mode code, which then again
is not known by software. What is needed is an extensive get_mode_info call
that fills in a structure with all relevant information.

>> That should be the user's choice, don't you think so ? Or are you thinking
>
> No, I think it should be the PROGRAMMERS choice. The environment that the
> game uses, what it looks like, and the options available to the gamer should
> all (IMO) be controlled by the programmer, and not the user.

Ok, but then you end up with the current situation with lots of games that
are not acceptable for many users. A user that wants it full-screen can still
extend to window to cover the whole screen, while it gives additional flexi-
bility for those who want it.

It's a bit more effort for the programmer, I guess that's all what you're
afraid of.

>> everybody else will think the same way as you do ?
>
> No, but it should be up to the programmer, not to the user, IMO.

That's the lazy programmer's position. It makes virtually no difference for
the user, only for the programmer.

>> > Find my someone who likes playing Quake no the PC in a window

>>
>> Because they can't. I'm sure I'd find some who would if it were possible.
>
> Sorry, but you clearly haven't hit <CNTL>-Enter in Quake (or Quake2, or
> even Heretic and other games of its age) as DOES work. [3dfx users can

Oh, good. Is it a true window, i.e. allowing other software use the freed
space ?

As I said, I'm not much of an action game player, I never played Quake.

>> Because they aren't aware of the situation. But you, as a programmer, are,
>> and you should be able to teach them on this, by writing an appropriate
>> paragraph in the README.

>> what I call fiddling with hardware to set video modes), but it leads to
>> the situation that few users can use the program. I know, people don't care
>
> So what do you call using documented OS calls?

Sticking to official documents of the institution that provides the standards.
The latter is a bit of a problem for the Atari world, as Atari doesn't exist
anymore, but earlier on they released an official paper that said "Don't use
Setscreen anymore."

> As for compatibility, shouldn't gfx cards be changing the _VDO cookie to show
> that they cannot cope with the facilities of the machine? This is surely
> what atari intended this for...

I'm not sure what gfx cards can do, but I suppose they should.

Practising is everything ;-)

Try writing another game while playing all those games !
:-))

> Yea, the "of course" maybe was a little over the top, but I am supprised
> that people actually try to play > 1 game at a time...

As I said, it solely depends on the type of games. Note a good game of chess
can go on for weeks or months. Should I refrain from touching other games
meanwhile ?

>> > so why have it only taking up 1/9th of your screen, with the rest displaying

> to strain your eyes...

I don't understand that "strain your eyes" people come up with so often.
My developing machine has 960x544 on an SM124, still I prefer to use a smaller
font than the system font, yet I can sit there for hours and work with it.

A friend of mine, however, has a 17 inch monitor, uses 800x600 (a PC), and

still prefers a larger font than usual.

The point is, it depends on the user. There are so many different users with different habits with different machines in different parts of the world, a programmer *cannot* take all into account. The only escape it making everything configurable.

"Everything" is a strong word of course, but at least the important issues should be covered that way. The part of the screen is one of those for all software IMHO.

>> >> > requires ST compatible resolutions, but that isn't the programs support - if

>
> Yea, by limiting the functionality available to the programmer. For a start,
> the STe/TT/Falcon's hardware scrolling cannot be used.

You're free to check if the hardware in question is there. If you need it, just add a bit of code that emulates the function on machines that haven't got it. Don't say emulated fine scrolling is too slow, be aware of the 100 MHz 68060 machine. It is happens to be too slow on some machine, well, provided you optimised the code, this is something not even the programmer can do anything about.

>> such a thing. The current situation merely makes me *suspect* that a given

> someone to finish GEMMA).

I wasn't specifically referring to Tony. I do not understand his situation well enough (in fact I think, considering all the praise he gets he seems to be a pretty good programmer for the limited (by STOS) means). But I've seen stuff in C that had all the discussed drawbacks, so there are such people.

>> > Oh, I'm not the one advocating that you change the way you program... thats

>
> Erm, so whats the difference? you are trying to convince him to change,
> aren't you?

Ok, in this very wide notion I try to change you too, as I'm trying to
convince you of certain things. In that way, all discussion is aimed at
"changing people".

I'm trying to change that Tony turns down GEM methods for games whereever
they are mentioned.

> Unfortunately, as has already been pointed out (quite a while ago... probably

As STOS is a compiler language, it can't be too difficult to provide a
reasonably fast GEM library, I'd guess. Provided all the usual elements
are there, arrays of 16 bit integers, inquiring the address of such an
array etc.

Cheers Peter

I don't know of a way without having to keep track of it yourself.

>--> Who knows a "legal" method for obtaining the current X-Y position of the text
>cursor?

If you place a virtual vdi workstation into proper text mode
(v_enter_cur) then delve through the related functions you might get

lucky and find a cursor position call. I don't remember ever having
seen one however. On the other hand, I've only ever used v_enter_cur
once just to see what it did.

What I *can* say, is that it's no use attempting to directly access
the vdi virtual workstation structures in case it crosses your mind to
try it. I spent an age doing/hacking this once in order to find where
each workstation stored its clipping rectangle so that I could
preserve the current settings (I forget why but it was important at
the time). This worked very nicely up until I bought nvdi whereupon it
all dropped dead. The workstation structures are not the same. I had
hoped that although undocumented to us, they were documented to
developers/DRI. No such luck!

I remember this was the point where I decided to dump all the LineA
stuff (and I had wrote a *lot* of it) and migrate to the vdi properly.

>Incidentally, what is exactly the situation with LineA for '030 and up Atari
>computers. I have heard inconsistent things on the subject.

You and me both. Some people say not to use it on "pain of death"
whilst others don't seem to mind. The only thing which definately is
lacking is definate information. [!?!!?]

Hopefully someone knows for certain although I have a suspicion that
the only way to really find out is to get people to test it. :-(

Still doesn't work. :-(

There still seems to be problems with the sound. I booted my STE off
floppy and it wouldn't unlock the sound system. Oddly it must have got
a little further when MagiC was running because no such alert
appeared, but it did bomb out out with either an illegal instruction
or a double bus error (ie 4 bombs).

Can you just disable the sound completely. All I want to see is if the
animation works? <G>

So you still get it??? Are you sure you are using the latest version? It
should
be 0.21 I think. You should not get that alert anymore if it's not a
Falcon. I
do not get it under STonX using TOS 2.06.

> Can you just disable the sound completely. All I want to see is if the

Hi, Guy,

Thank you for your sound answer.

In article <35015098.4089830@news.demon.co.uk>, guy@swampdog.demon.co.uk (Guy Harrison) writes:

>>However, I would like to get rid of LineA. Well, but I am unable to figure out

>>computers. I have heard inconsistent things on the subject.
>You and me both. Some people say not to use it on "pain of death"
>whilst others don't seem to mind. The only thing which definately is
>lacking is definate information. [!?!!?]
Oh, thanks a lot. Maybe I am not so ignorant after all!

>Hopefully someone knows for certain although I have a suspicion that
>the only way to really find out is to get people to test it. :-(
Yes. I suspect that my thing will end up that way...

Now, I would like to describe more accurately my problem.
Originally, I didn't want to inflate my first message, but I should have.

I have written a patch for the driver of my Nova graphics card. This patch works very well. I am using it constantly. Let's even say that I can't live without it! So, I have decided to make it public. And then came the question of having it programmed as cleanly as possible, as opposed as just working

for ME!

The patch deals with bugs in the VT52 emulator. Here is how it works, briefly.
The patch steals the Bconout(console) vector and sits there. When a non-bugged
escape sequence comes in, it just let the original handler do the work.
If it is a bugged one, then it does its own stuff and returns. To operate,
the patch MUST know the current text cursor position (as well as character
cell sizes). I obtain a lot of information via a cookie installed by the
card driver, but cursor position is given ONLY by LineA, to my knowledge.

Let me insist. The information is needed from WITHIN A BIOS HANDLER. I can't
make any VDI call, for example, from there...

Any idea, anyone?

Cheers.

is there any software that can back up Playstation CDs to HD ?
or copy them directly to another CD, like the PC DAO software ?

Forcing a game rate compareble to 50 frames per second on a 60 Hz
updated screen would result in a very annoying hickup, because every
sixth screen 2 screens will be the same. This is very visible. Changing
the graphics so that they will move at 5/6 of the 50Hz speed in a 60Hz
screen mode is not possible (unless you start with floating point
operations in a game). The best solution is to run the game at 6/5
of it's intended speed. This won't make a game unplayable.

It will, but the smoothness of the animations will be lost and that is
more important then splaying exactly at the same speed.

I think the best way to get games written for th ST running on
the more exotic mordern hardware will be a coversio routine converting
ST low screens somewhere in the memory at 50 frames per second to a
VDI screen, or even better a GEM window. For a good game on a ST
you have to program directly on the hardware with all tricks you can
find otherwise the game will be too slow.

I suppose you mean moving the screen start adres eight lines up
or down? (By adding 1280 to shte screen adres.)

BTW: Full screens in my terminology are 400x240 screens. You know,
those screens without borders. Using the same techniques needed
for fullscreens you can start the screen adres at word boundarys.

For a good examble have a look at "The dark side of the spoon"
demo by ULM. The main menu is fast 8 way scrolling in 400x200
resolution and they are playing a MOD file at the same time. And
all this on a play 8 MHz ST.

>> screen cheap hardware scrolling on a fm easy in one vbl, but only

>I suppose you mean moving the screen start adres eight lines up
>or down? (By adding 1280 to shte screen adres.)

 :) you can get 4 pixel but it takes twice the memory..but yes thats the trick.. not a great lot of use.. accept you can mkae yourself a nice little ripper program by loading a game or something into memory and scrolling through it :)

>BTW: Full screens in my terminology are 400x240 screens. You know,

 just the way its said.. when I say full screen i usualy mean standard work area..however it is open to confusion..

>those screens without borders. Using the same techniques needed
>for fullscreens you can start the screen adres at word boundarys.

 I can display full screen and made a program called SHOWTIME... quite a few years ago.. that would search your hard drive and take all your neo or pi1 pictures and plonk them on the screen stretched and displayed at 100% overscan.. a long time ago and its only value was as stated in the docs.. a novelty slide show ..
 However I never tried moving one...I find removing borders or whatever to be far too unstable....probably STOS fault..:)
>
>For a good examble have a look at "The dark side of the spoon"
>demo by ULM. The main menu is fast 8 way scrolling in 400x200

 arrrgh... sorry but I dont have any demos, dont know where to get demos and have never wasted my time looking at demos... I have never actualy seen the point of a demo...

 (Now watch the feathers fly! <grin>)

Hi, I have some Atari stuff for sale.

Atari 1040STf for $60.00
Atari SC1224 Color Monitor for $40.00
Marcus Trackball (RB2-114) for $10.00

Or all three for $90.00

Please contact me at maxdaisy@<nospam>arn.net. (without the <nospam>)

Thanks,
Steve Brown

Which is why I described it as a "minor point" when I raised this subject.

> > designed for, but all machines, provided there is enough CPU power. So
> > your example of the TT's VGA with 70 Hz does not cause problems anymore,
>
> TT VGA is 60Hz.

I think the Falcon's VGA is 70Hz (well, maybe not, as everything is different,
but official "vga" is 73.xHz, IIRC...)

> I think the best way to get games written for th ST running on
> the more exotic mordern hardware will be a coversio routine converting

As Peter is fond of saying, there should be no problem doing this
on a 100Mhz 060.

> ST low screens somewhere in the memory at 50 frames per second to a

right, so in a GEM game, where you cannot page-flip, and you are not aware of
when the VBL takes place (unless you are recommending that a GEM program
should call a blocking call such as Vsync, which IMO destroys many of the
benefits of using a modern GEM! [multitasking]), how do you make sure this
doesn't happen?

> > Maybe it isn't good programming style, with regards to portability, but making

Yea, but if it works on the slowest machine, as my examples do, it is possible,
as there isn't a machine not capable. You are saying that we should take these
programs, slow them down, and then not be able to easily identify
which machines
it wont be playable on... right...

> the box has plenty CPU power compared to most other Ataris, and since

Yea, except you get jerky animation.

sorry, I missed a few words out... "runs 1 FPS on an ST". FPS=Frames
Per Second.
"Speed" would perhaps have been a better word.

But surely it is better than nothing? The VDI does not (currently) offer
any equivelent...

> > No, I think it should be the PROGRAMMERS choice. The environment that the

"many". I still haven't been convinced that Hades/Medusa/Nova users are a
significant portion of the games "market".

> A user that wants it full-screen can still
> extend to window to cover the whole screen, while it gives additional flexi-
> bility for those who want it.

Yea, at a significant cost.

Yes, of course - I just tested it while writing this email.

> As I said, I'm not much of an action game player, I never played Quake.

Well, it drops down from about 30fps to ~5fps on my machine. Now tell me
that writing to a window is just as fast (using the PC's API there is no
difference to the game, except for the fact that when it requests a window
it may set a flag for FULLSCREEN mode).

True, but that was with the release of the TT. In the Falcon, they extended the
functionality of Setscreen. Why, if it wasn't supposed to be used anymore?

> > Yea, but do you ever really try and play solitare, patience, landmine etc.

Maybe its because I have dodgy eyes...

> My developing machine has 960x544 on an SM124, still I prefer to use a smaller

Yea, fine...

> Don't say emulated fine scrolling is too slow, be aware of the
> 100 MHz 68060 machine.

Sorry, but I really dont see why every programmer working on a lower-end
Atari should have to write all this sort of routine for the high end machines,
when it could be emulated at the system level by hades owners/programmers...

> > Erm, so whats the difference? you are trying to convince him to change,

Yea, true...

> I'm trying to change that Tony turns down GEM methods for games whereever
> they are mentioned.

I agree to some extent. Tony wouldn't like a GEM based file-viewer - but
this is largely influenced by the fact that running on an STe in ST-Medium
with TOS 2.06 really isn't the best environment for this...

> > around message 20-50), STOS doesn't provide access to GEM in a compiled

> array etc.

yea, thats all present... but STOS does some rather odd things, which
makes it pretty difficult to make it work (if you saw their memory management
routines, you would go mad! Until I patched it, it caused a bus error just

to find out what TOS version you used!)

For many years, it was stated as FACT that it was impossible to call GEM from STOS (even the authors said this). This has been shown to be incorrect, but it certainly isn't simple.

Hey! Anthony Jacques <jacquesa@zetnet.co.uk> wasn't it Thu, 5 Mar 1998 18:34:30 GMT that you wrote:

>Hi
>
>I've just posted an update on my WWW pages... please read/

Read it.. welcome to ATARI IRC.. one side of which use and enjoy irc, the other side just sit there.... watching.. waiting... I even had one so called ATARIan attack me as soon as I went on the channel because I was using mirc... what!...four fecking yrs I have been using channel atari .. then some arsehole tells me off.. suggests that the channel is for real ATARIns and not for ex ATARI users.... what a bunch of tossers.....

Well I carry on using the channel.. I was there before most of them

and will be there long after they have moved on.. No one can have a
dig at me for not supporting ATARI and I suggest you take the same
line.. anyone having a dig at you for not supporting the platform are
just sad know nothings... wish I had been there mate :)

Ignore them is what I say...or wind them up... Thats the advice you
gave me when I got some nasty emails about downloads on my page...

You have angoing ATARI projects.. most of us do.. let the sad tossers
who spend all day on #atari irc keep attacking us because we also have
a PC... they simply dont have the brains to compete mate... deep
breath , count to ten... then slap'em :)))

>respond (by email,preferably)...

What and miss all the fun ? :)

.

Cheers -- Tony Greenwood (Official Filos Examples Programmer)

I concur. If you ever actually _used_ MS Write and got any kind of
decent output, you're a far better man than I. Write was way worse than
worthless (damn! what's a synonym for than that starts with w?). Even
Word Writer would be better, though WordUp is a good replacement.
Personally, I would go with a cheap copy of Calamus 1.09n or Pagestream.
They're overkill, but they're cheap!

Why Gates would ever think that users of computers with a Digital
Research based OS would use an MS product is beyond me...

Dan

Hmm, something wrong here ? Couldn't find any screen shots. Found all sorts of neat things, but no screen shots, looking in every corner where the link sounded remotely like it could lead to shots. So you'd need to give me the direct URL for the shots.

Cheers Peter

Talking about VBLs, will you even have a correct VBL with a graphics
card?
I can't imagine that the Nova card can provide a true VBL, or can it? I
would guess that you will get the "old" VBL and not the VBL from the
Nova
card.

Sorry, missed the start of this thread...

I've been hacking around the JPEG decoder by myself without any documentation, but have got some code to work, including using the executable within your program rather than relying on the AUTO-folder program. The code will be in the next issue of Maggie which is due out in about 2 weeks (assuming Chris Holland gets all the other stuff in time)

I wish I had had that documentation about a month ago!

Dan,

> Why Gates would ever think that users of computers
> with a Digital Research based OS would use an MS
> product is beyond me...

The problem wasn't that Microsoft Write (or more commonly known as "Microsoft Wrong") was a MS product --- the problem was that its was BAD software (even by Microsoft standards). About the only way that Atari could help promote it was to give it away for free by bundling it with its systems in the late 80's.

As an Atari dealer, I found it much less aggrevating to REMOVE it, throw it in the trash can and substitute Word Writer in the bundle before delivering new systems to buyers. There's nothing worse than delivering a new Atari system to a customer and then having to try to explain why he or she couldn't get the bundled software to work properly and have face needless hours of total frustration.

Atarians didn't buy their systems to have to face that kind of aggrevation. We EXPECT our systems and software to install and work easily and properly WITHOUT having to read exhaustive manuals, 'made-easy' books, or undergo hours of needless frustration.

Most ANYTHING would be a better choice for word processing than Microsoft Wrong!

I own GenST (DEVPAC assembler) but I don' have anymore three files (missing, and I have to work with them) : XBIOS.S, GEMDOS.S, EZMAC.S.
I you have these (those ?) three files, or if you know where I could buy again DEVPAC assembler, please tell it to me !
Many thanks to you all.

Sorry to reply to your post Peter, but Thomas's hasn't appeared yet.

Yes, I agree on *(a + (b)) but as I interpret it that still doesn't

make it work. Unary minus has right/left associativity. As I interpret it, [] has highest precedence so that expression is evaluated first. The expression is not simply [cp] but 1[cp], then the unary minus gets applied. To obtain the correct result you need to write ...

(-1)[cp]

... otherwise *(a + (b)) would need to be redefined as *((a) + (b)) which, to my knowledge, is not its definition. -1[cp] is really performing cp[1] then applying unary minus to the result which is nonsense.

It isn't me guvnor, honest!

>The number $5a0 is not (COOKIE *), but (COOKIE **).

Yep, Silly me.

>So you should write "cp = (COOKIE **) 0x5a0;" and only then you'd get
>the first cookie by "**cp".

It's that lovely subjective area of 'C' isn't it. I meant to write "cp
= *(Cookie**)$5A0" but mentally took out one level of indirection
because I was thinking "array access". Bum! :-(

Hopefully I haven't made a similar mistake in my last posting. Coming
to a newsgroup near you soon... ;-)

 Ho give me a break, If you quote all the paragraph you would have
included the bit about him having to reboot his PC and the lots of
smilies.. I know no other way of showing it was a Joke, other than a
big sign especialy for you...Come on Peter I aint that bad :), It was
aboviously a humorous dig at Guy and rebooting... tsk ?

>I agree entirely with Guy ! Software must have the option to exit cleanly,
>not leaving a messed up machine.

So do I, and I have very intricate error handling routines in my
software, with STOS you have many options, the glory of line numbers
:), you can give the user the option to try the offending line again,
jump to another line of code, soft boot or cold boot or just clean
exit to gem... I have these as a standard subroutine I import into my
software.....I agree with you both, there is no reason why it
should lock up and just sit there....

 But where would be the fun in that ? :))))))

 OK I agree I do have a tendancie to do this, But I try not to swear
or personaly insult anyone or there efforts in the ATARI comminity, I
just like to have a good heated debate.....its fun, its not real
life and it doesnt actualy harm anyone,

 IF! anyone wants to wade through this thread there is two ways of
looking at it.. either a load of fools fighting.. or they can sift
through the information and learn, because I know I have picked up a
few things along the way :) in and debate like this, lots of
information is bandied about :)

>games ? What amount of money do you take for them ?

 You should already know that my titles are FREEware, I do not believe
in sharware or commercialism on the ATARI market in this day and age..
but hey thats another deabte ..

 A market to me is defined as supply and demand, I am making a game at
the moment and people are testing it and poeple still ask me when it
will be ready,

 Thus there is a demand (albiet slight) for games, if there was no
demand at all then i would make other things, But I enjoy making games
and while someone wants them.. then there is a market isn't there ?

>for him ;-)

 You are correct to a point... I can play missile command for hours, I
find it very therapeutic and theres no scrolling,

 8 way scrolling is very hard to do on a FM thus its the most
impressive, I think you have to see heartland or diamond ice running
on a one meg FM to understand what I am talking about,

 Plus its the difference...I believe something like a Chess game could
easily be made to the specifications you people want, to run on every
machine with an ATARI logo, but the games I make ...well ?

This is getting silly... so lets clear the air a little. cards on the
table :)

This is what I do.....

<start>----------

A standard Arcade style game

1) 8 way scrolling.
2) Optimum screen size of 200x200 remainder taken by info
3) 32x32 main charactor sprite
4) 20 individual free roaming sprites (Free roaming does NOT mean set paths, the sprites act on object placed or removed by main sprite) also this is per level,
5) 16 Colours
6) Screen overlay, so sprites move behind scenery
7) Full one meg of memory (to include standard floppy disk setups)
8) Background Music AND Sampled sound for FX, split into following
    FM=Background sound only
    STe=Background sound and sampled FX
    Falcon and above Sampled FX only
    Falcon to have enhanced sound quality
9) Animated backdrops, Unlimited animation on game backgrounds
10) Joystick support
11) Support for Minimum 1 meg FM to Falcons with Nemesis or other fingies?, Also TT's and megas

STOSSER Software games support all the above, Older releases may of course not, but the last half dozen games will implement at least some of the obove, with at least one game supporting ALL of the above thus proving it can be done,

<end>----------

1) If you can do all of the above AND better, then please do give me the benefit of your knowledge and I will gladly read and learn and be thankfull :))

2) If you can not manage at least the above (and I don't just mean in your head) then you still have the right to offer advice, but you hardly have the right to TELL ME! I am programming the wrong way?

NOTE...we can all take each of the above game points to pieces and offer better, but can you offer better and support the rest of the spec at the same time?...

I really don't mind you people telling me I am doing it all wrong and how you all know better :), but you havn't even looked at my software so I don't understand how you can say the same things can be put in a GEM window ?,

I dont appreciate people telling me all I need is an art package capable of 256 colours to be able to make Falcon enhanced games :(

I don't appreciate people telling me I should make Falcon enhanced games... but don't need to test them?, this is equaly as silly as the

256 color argument,

BTW, I am enjoying this thread and contrary to popular belief I have
the greatest respect for the people I am conversing with and see this
as a debate and not an argument :))))

Could someone please tell us how to change resolution on a GFX card?
If we want games to work on our gfx cards people must know how to
set up the correct mode and it must also me defined so that all
gfx cards drivers support it.

If you have Pure-C, maybe... but I use Lattice so it would be to much
work

to do it. I don't think I have seen the sources for it either for that matter.

Shit, I feel like a dog today.... :-\

Hehehe.. I would guess he loves scrolling bacause he uses such a low
resolution. Even if he has got an area covering 2 screens in a pinball
game he still only have 320x400. I have atleas 800x600 minus menues and
window borders taking it down to lets say, 800x540. Still plenty of room
for the playarea. ;-)

Also for those who would like to try my little attempt to a PacMan
clone,
I have now updated it and hopefully it now works on a regular ST....
it did crash under STonX (and so does Marios game) so maybe I use
something
that the ST doesn't like.... could be some AES 4 stuff. But I don't have
time
to try it out more.

I guess it wont work on my Nova either then. :-\

Aha, so here it's room for improvments. To sad that I don't know enough
of
this to be to much help. :-\

Okey, we will remember that.

> If we're going to have any games at all for the TOS/MiNT/Fenix/MagiC/Dolmen
> platform in the future, we _have_ to make it possible to write them using
> a standard graphics interface.

It sure would be nice and it sure would help alot.

This is an idea. Make a STOS compatible VID library and jsut recompile
your STOS
games and hey, they will run under any TOS version with fVDI. ;-)))

> >make
> >it work on any TOS box you just install fVDI and the correct driver and

Could be added later. No problem. :-)

> On my 1008x608x4bit screen there's room for a lot of ST-low games at once.
> ;-)

Hehehe... I wonder why Tony removed that part? :-)

Well I think someone missed something here. I did never say that ALL
games
should be made to run in GEM, but many could and it would solve alot of
problems and make some of them even nicer to run. Not to mention that
a few people havn't access to ST-Low. We are not just talking about
Tony's

games, we are talking globaly. :-)

> Who knows what it'd do on a Hades/whatever...

Well, I removed it if it doesn't detect a Falcon (you can disable it in
the
settings dialog to try and see what happens on a ST/TT/Hades). I must
say
that the code was very strange in a few parts and I wonder what I was up
to.

Also, it looks like there migh be a problem when I'm trying to open the
game
window. Will a ST crash if have added the "SMALLER" button or will it
only
give a error message? On TOS 4.04 it's just ignored. There might be some
other
AES stuff which might clash with something.

Subject: I need help with F2C
Date: 1998/02/27
Message-ID: <6d72sv$c9s@shell1.interlog.com>#1/1
X-Deja-AN: 329261282
Organization: InterLog Internet Services (416) 975-2655 info@interlog.com
Newsgroups: comp.sys.atari.programmer

Can someone try to compile the fortran code listed below using the F2C code converter? I can convert it to C, but when I try to compile it (gcc -v -O nbase.c -lf2cslow -lpml -o nbase.tos) using the TOS 2.5.8 version of gnu-C I keep getting these error messages from gcc-ld:

```
rsfe.o : Undefined symbol _rd_ed referenced from text
rsfe.o : Undefined symbol _rd_ned referenced from text
```

From the readme file:

This archive contains an Atari ST/TT implementation of a Fortran-to-C compiler, developed by AT&T Bell Laboratories and Bellcore.

```
- notice       information about copyright, warranty etc.
- f2c.ttp      the compiler itself
- f2c.1        man page
- f2c.1t       man page for nroff/troff
- f2c.ps       Technical report about f2c
- f2c.h        include file
- f2c.olb      library for 68020/30 machines with 68881 (i.e. Atari TT)
- f2cslow.olb  library for any Atari ST/TT (68000, no FPU)
```

The last three files depend on the C compiler being used to compile the C programs produced by f2c. The versions included can be used with GNU-C 1.40 and probably also later releases. In the following it is assumed that you have a working installation of GNU-C on your system.

Perhaps the f2c utility and library code needs to be re-compiled using a new version of GNU-C? I've tried to do this (God only knows

how I've tried!!) but have been unsuccessful.

Any help would be appreciated !

True, but you really cannot expect (timing dependent) games to be written in resolution independent video modes.

> Since then at least, switching video modes via Setscreen, or inquiring
> video modes and screen addresses by XBios means is a no-no, i.e. to be

Yes, I agree that Atari said to do, but they didn't really give much choice!

> It can all be done in a 100 % portable way by using VDI, so it's that

So powerful you cannot even request that the machine changes video mode.
If a machine supports 16-bit graphics, shouldn't a game be able to request
that the machine use that mode?

> >> Do you think that Setscreen will work with ISA/PCI graphic cards?
> >

It cannot change resolution though, which is what I was talking about.

> Newer NVDI even support switching
> resolution IIRC.

Well, I could find no mention of this in the NVDI 4.1 (english) documentation.
AES 4.x supports a resolution change, however, but this is not useful for this
purpose.

> >> "It is maintained fo backward compatibility with existing ST programs only.
> >
> > Yea, so it should WORK AS DEFINED FOR THE ST.
>
> The problem is it CAN'T.

If the machine can display ST Low, then it should be able to use setscreen
to change into it. If it doesn't, then the program wont work, as it clearly
requires ST compatible resolutions, but that isn't the programs support - if
the machine cannot do what an ST can do, users should EXPECT games designed
for the ST not to work.

> There are so many technological reasons why it
> must fail. With graphics hardware that does not support 320x200, there is
> no way a Setscreen could switch it to that. With graphics hardware that

Correct, but then people shouldn't complain that a game that was principally
designed for the ST doesn't work if your machine doesn't provide an ST
compatible video mode.

> keeps the screen buffer on the card and not main memory, there IS NO WAY
> one could access it by inquiring an address from Physbase.

Why not? you can write to video memory on the PC, so Physbase could easily
just return the address that the video ram is mapped to. Of course, moving

the physbase could be problematical.

> BTW You refuse to read :
>
> >> "It is maintained fo backward compatibility with existing ST programs only.
>
> This means : You must not use it anymore ! Even if you think with the program
> you're writing ST resolutions are enough. It means you cannot rely on

True, but then, STOS is an existing ST program...

> > WORK AS DEFINED FOR THE ST.
>
> It means if it fails for some old program than it's bad luck for the program,
> but then it's the program that's to be considered broken. That is what "back-
> ward compatibility" really means.

Well its not compatible if its not supported... surely you aren't saying that
its ok to drop OS calls as and when you want to, and still call it compatible?

If, say, Super()/Supexec() was removed from user programs (as has been
suggested!) under a multiuser environment, would you still call it TOS
compatible, even though many (most) programs would no longer work?

> > Yea, and prey tell, how does the VDI change in to ST-low then?
>
> If the hardware does not support ST-Low, you cannot switch to ST-Low. Period.

And if it does? How do I tell the VDI to change into ST low on an ST in medium
res? How do I do it on a Falcon [ignoring the hack in Vsetscreen, as you say
I shouldn't use this]? How do I tell the VDI to change into ST Low on a TT?

All of these machines support ST-Low, but the VDI cannot change into
it - either
telling the user to change into that mode or using the xbios or directly
accessing the hardware are the only options. Telling the user to change mode
has already been complained about in this thread (I think it was Magnus).

> So you'd better make your software deal with a variety of resolutions.

Why? this adds an extra variable to a game which can make it play incorrectly.
Next you'll be telling me that all games should make use of dithering in
mono.

> >> There is no working Setscreen call on the newer machines. All you can
> >> interrogate are VDI functions. (current resolution & color depth)
> >
> > Wrong - Falcon has Vsetscreen, and Vsetmode.
>
> No it's true. Or do you consider the Falcon a newer machine ?

I consider it significantly newer than the ST, and it was definately after
the TT, which is where the quote was taken from.

Interesting. Until I've profiled the TML routines there isn't much to
compare it against (except for NVDI/fVDI/VDI which I guess you already
have done :)

> >> nice generic routines in the VDI are going to be anywhere near as fast.

I would guess this is one of the reasons why NVDI is faster than Ataris?

> >Ataris VDI will be way to slow. Now when Johan in working on the next

> but for 16x16 sprites it makes a _lot_ of difference. The current VDIs

Yea, and if the whole screen is made of a tile of 16x16 sprites, with many
further sprites plotted on top, the setup time could become pretty big...

> If you people could stop fighting and instead do some constructive thinking
> on this subject, I'm open to ideas for implementation in fVDI.

Good :)

> For example:
> - Reduced bitplane drawing
> - Masked blitting
> - Multiple blits

For anyone who doesn't know, all of these optimisations are used in The
Missing Link (STOS extension).

> Comments or suggestions, anyone?

Adding the above to the VDI would be nice. I would guess that blits are
also written in such a way that they run faster when word-aligned?

A way for a program to request a different video mode would be a big bonus.
something like v_requestmode(short xres, short yres, short planes). The
call could return the "closest match" to the requested resolution, and allow
the program to reject the mode if it is not good (or close) enough.

I guess this would need to be a "full-screen" mode, or whatever, so some
method of preventing other processes to write to the screen would be
necessary.

I'm sure there are a number of other things, but I cannot think of any
right now.

> Since I don't program games myself, I won't attempt to create a useful

Well, appart from the odd bit of Bad Mood. :)

> VDI extension for it. If something can be agreed on, though, I'll

I agree, we need a standard that is capable of supporting these things...

> >make
> >it work on any TOS box you just install fVDI and the correct driver and
> >off you go.

> >Doug. :-)
>
> Actually, 3D APIs were discussed a little at the beginning of the fVDI
> design phase. It's not in the current plan, though.

Hehehe... now that would be cool (as would fVDI with all the things you
have planned).

> >> If you read his post above, even Magnus doesn't believe games like Tonys
> >> are possible on a plain ST.
> >
> >Well a 8-way scrolling game is a bit much.... but still with a fast
>
> If hardware scrolling isn't used there's nothing that says it wouldn't be

Yea, Tony doesn't use this, as only a few extensions (mine included) support
this in the sprite routines.

> as fast in a window. It's the same memory, you can force the window to
> be word aligned and you could simply stop the game temporarily if its

But I wonder what putting an event_multi() loop into a game would do...

> On my 1008x608x4bit screen there's room for a lot of ST-low games at once.
> ;-)

Yea, plenty on my 1152x864x16-bit with 17" display. :)

When using my Falcon I have a slightl lower res than yours though (~900x608).

Anthony

Well, a 256+ colour game is certainly not AT ALL designed for Tonys development machine, which is what you were advocating.

Writing a 16-colour game that will run in any resolution with a big enough colour-depth is one thing, writing a 256 colour game on a machine with only 16 colours is something completely different. That certainly is not a portability issue.

a quote from Peter (I'm sure I'll be accused of taking this out of
context, but...)

8<- - - - -

BTW You refuse to read :

>> "It is maintained fo backward compatibility with existing ST programs only.

This means : You must not use it anymore ! Even if you think with the program
you're writing ST resolutions are enough. It means you cannot rely on

8<- - - - -

Maybe I'm misunderstanding this, but to me it is pretty clear that Peter
thinks that *all* new programs should be written using the VDI (part of
GEM).

I agree with Magnus' above paragraph that some games would be enhanced
by the VDI (after all, I do have high-rez output), but I dont agree that
all programs should - particularly those developed on a lowly Ste with no
hard-disk and only a single 720k DD, where the intended majority of users
are ST users, and the games themselves are pushing the limits of the ST
hardware.

Its ignored on TOS 1.00. I haven't specifically tested this on any other
TOS version (well, except for TOS 4.92, in which you will get the SMALLER,
but it works differently so you will screw things up as you will not get any
WM_ICONIFY messages).

> other AES stuff which might clash with something.

Yea, maybe some Magic stuff. :)

Same on older Tos's. You can be fairly certain when setting these
extra attributes (ie OBJECT trees also) that older Gem's will ignore
attributes it does not know about. It was designed like that so future
versions could add extra features.

>There might be some other AES stuff which might clash with something.

The only major problem I've ever had was in using bits 10 and 11 of
OBJECT.ob_flags for Pug's CHECKABLE, OUTLINEABLE and CROSSABLE
attributes. This was before I got online and the docs I had then said
they were reserved for the programmer. Unknown to me Atari went and
used them, and as anyone whose tried to hack one of my resource files
will know, when they set BACKGROUND OR ACTIVATOR on an object, they
are also telling Pug to draw a check mark when the object was
activated. ;-|

As I was certain these flags would never need to change they got hard
coded into Pug all over the place (70+ source files involved).
Needless to say, it is only with Pug version 0.9 that this has been
fixed for sure. Now I can finally make 16 colour programs by golly!!

So the moral of the story is, assume it might change 'cos it darn well
will if you don't cater for it!

g > To obtain the correct result you need to write ... (-1)[cp]

I stand corrected. I still prefer *(cp-1) unless cp really is an
array (in which case you shouldn't be trying to access the [-1]
entry).

BTW, one of my favorite tricks is to use pointer arrays to access 2
(or more) dimensional arrays:

```
    double a[6][8],*pa[8];
    for(i=0; i<8; i++) pa[i] = a[i];
```

Accessing pa[i][j] is faster than a[i][j] and can be passed as an
argument using variable dimensions.

> > Do you think that Setscreen will work with ISA/PCI graphic cards?

Dolmen o/s Xbios layer includes video mode

selection that accepts x,y and bit depth as a
parameter and functions to handle hardware
scrolling and virtual screens, runs on the
Falcon (with or without accelerating boards
extended resolution) and is also provided
for backward compatibility as a standalone
Auto folder program called "CentScreen 3.0"
it will handle correctly resolution switches
on video cards too....
developer information can be obtained by
requesting it by e-mail !

anyway SetScreen is not so bad when you
know how to use it...

bye,
DAVID GODEC

> > > the Falcon's IDE on/off switch

according to hardware specs,
this is not a On/Off switch but a RESET
switch, when it's low the drive(s) spin
down ,that's because people believe

it's a on/off switch,but don't keep it
low too long because it's not a normal
status for the drive and it may not
like it very much .....
there are Ide commands to spin down
in a cleaner way !

bye,

My profiler is mostly intended to examine the VDI in normal operation,
but the actual timing code could be used for other things as well. The
accuracy is somewhere around 1/30000s (I'm reading the timer registers
themselves as well as counting interrupts), which is enough to make even
the very fastest VDI routines (like line colour setting) register on my
AB040 (but it's down to one 'click' per call in that case).

>compare it against (except for NVDI/fVDI/VDI which I guess you already

So far the program has mainly been used to test the general VDI usage.
There is no reasonable VDI performance test program yet, that I know of.

It sure would.

>> For example:
>> - Reduced bitplane drawing

I would imagine so. ;-)

Any chance of some cooperation? I haven't written much of the low level
code beyond monochrome yet.

>Adding the above to the VDI would be nice. I would guess that blits are
>also written in such a way that they run faster when word-aligned?

I'm sure NVDI does that, but fVDI doesn't worry much about sub-'040
processors at this time (a shift or two takes no time compared to the
actual screen accesses with an AB040). There were quite enough versions of
the blitter code to write, anyway, just to make things _work_. I believe
that the monochrome blitter source (which should handle all the vro_cpyfm
operations) is more than 30kbyte assembly as it is.

>A way for a program to request a different video mode would be a big bonus.
>something like v_requestmode(short xres, short yres, short planes). The

Yes, something like that is needed.

>I guess this would need to be a "full-screen" mode, or whatever, so some
>method of preventing other processes to write to the screen would be
>necessary.

How about: wind_update(BEG_UPDATE) ;-)

That works just fine under MultiTOS etc.

Anyway, I think there should be a way to get at a private screen, since
games often need double buffering. The actual drawing operations in fVDI
already rely on the VDI handle (which is actually an index into a table
of pointers to VDI structures) for all information about where to draw.
Implementing things like off-screen bitmaps would be very simple.

In combination with the Fenix AES, fVDI is supposed to be able to deal
with switchable 'screens' in different sizes and with different colour
depths.

>Hehehe... now that would be cool (as would fVDI with all the things you
>have planned).

So, you've visited the WWW pages?
There are indeed quite a few nice ideas there, but if I don't get any
help with the programming...

>> as fast in a window. It's the same memory, you can force the window to

>> game to change the palette colours when its window is on top, but there
>> are ordinary GEM programs that do that already.
>
>But I wonder what putting an event_multi() loop into a game would do...

As long as you use an AES that can return immediately when there are no
messages to process, there shouldn't be a problem (I wouldn't expect an
action game to run in a non-topped window). Some new mechanism to get at
keyboard/joystick/mouse input might be needed, though.
Perhaps we should take a look at DirectX?

Also, fDI is fully reentrant (and will later on be callable without using
TRAPs), so you can call it from an interrupt if you need to.

>> On my 1008x608x4bit screen there's room for a lot of ST-low games at once.
>> ;-)
>
>Yea, plenty on my 1152x864x16-bit with 17" display. :)

I'm using that on a 15" monitor on my PC, but I've got good eyes. ;-)

Hi

I'm writing an extension for STOS, but I can't find a way to get the commands in the compiler extension to talk to each other. I know it's possible because the Control Extension does it - there is a command which sets the screen size, and one that sets the cliping area: the rest of the screen commands use the variables set up by these two commands. I am after something similar...

Any ideas? All the docs I've got on extension writing say it's impossible.

Actually, an even better idea would be to use the commands to set up the screen from the Control extension. This would mean that you'd need Control to run my extension but it would save on an extra two clip commands, and everyone has Control anyway don't they?

Cheers,

James Arthur
jaa@arfa.clara.net

PS A beta of my extension will be available at my website at http://home.clara.net/arfa/stos from a few weeks time, and I am always on the lookout for new ideas so any suggestions would be appreciated.

Hi all!

I was wonderingif someone here might be able to help me.

I need to have a function that returns a random value, and a function that initiates the randomizer.

I know that the system provides this to me, but I need one that is system-independent.

So can anyone help me with these functions?

Hi

> I'm writing an extension for STOS,

Welcome to the club. :)

BTW, do you know about the STOS mailing list?

> but I can't find a way to get the
> commands in the compiler extension to talk to each other. I know it's

You mean a common data area? Its a bit wierd at first, but once you've sorted it out its not too bad.

> possible because the Control Extension does it - there is a command which
> sets the screen size, and one that sets the cliping area: the rest of the
> screen commands use the variables set up by these two commands. I am after
> something similar...

Right, after the "parameter lists", you have the Cold-Start routine, which is called on start-up. well, simply use something like this...

```
* jump to the real COLDSTART routine
DATA bra COLDST

* here is our data area. Put as much as you like in here (although with older
* versions of the compiler there is an accidental limit...)
* note that adding stuff here expands the size of the binary...
planes  dc.w 4
xres  dc.w 320
yres  dc.w 200

* The REAL initialisation code

COLDST lea END(pc),a2
 rts
```

All sounds easy, so far, yes? well, here comes the slightly odd bit... At the top of any instruction wishing to access this data area, use the following code:

```
* set video(xres, yres, planes)
LIB1 dc.w 0  ; no external calls used...

 move.l $92c(a5),a3 ; $92c is a predefined offset
 move.l 0(a3,d1.w),a3 ; do not corrupt d1 before doing this
    ; and make sure you dont corrupt a3 after this!

 move.l (a6)+,d2 ; get the parameters from STOS
 move.l (a6)+,d1
 move.l (a6)+,d0

 move.w d0,xres-DATA(a3) ; move data into the global area
 move.w d1,yres-DATA(a3) ; I think you can work out how to
 move.w d2,planes-DATA(a3) ; get the data back out again.

 rts   ; drop back out...
```

Thats all you have to do...

There is another way to do it by manipulating a0 in the coldstart routine, but personally I dont like this method - its only really suitable if you want a chunk of memory, rather for global variables. Shout if you want details of this...

> Any ideas? All the docs I've got on extension writing say it's impossible.

The Games Makers Manual description for how to do this is really poor, but it does mention it... ISTR that there is an example of this in my "skeleton" extension on my WWW pages.

> Actually, an even better idea would be to use the commands to set up the
> screen from the Control extension. This would mean that you'd need Control

This is something I haven't worked out. I'm sure it must be possible, but I haven't worked out how to share common data between extensions (appart from providing specific STOS commands such as:-

```
   a=data_area_extn_1 : set_data_area_extn_2(a)
```

which would require that you get Les to update Control, and tell you about his data formats... which isn't going to happen (I haven't heard from Les for quite a while).

Actually, you could maybe do it using "internal library" instructions, but there is very little documentation on this (and looking at disassembled versions of various extensions, I am not aware of anyone who has implemented these...)

I believe this is the reason why TML requires that you pass so many parameters - I dont think TopNotch worked out how to share data between the 3 separate extensions...

> to run my extension but it would save on an extra two clip commands, and
> everyone has Control anyway don't they?

No, I dont use the Control (although I have it... a pre-release beta).

> PS A beta of my extension will be available at my website at
> http://home.clara.net/arfa/stos from a few weeks time, and I am always on
> the lookout for new ideas so any suggestions would be appreciated.

I'll take a look at your pages to find out what you've already thought of.

'tis a shame...

> Any chance of some cooperation? I haven't written much of the low level
> code beyond monochrome yet.

Well I have some rather braindead 8/16bpp mode stuff, although I'm sure its
nothing you couldn't work out. I have quite a fast setpixel() routine that
that works in most planar modes (2->8).

I've (sort of) got access to the TML 4bpp modes, but theses are all hard
coded for 320x200, and are not too easy to understand (and appart from
putpixel/setpixel, and various copy ops, it doesn't have any non-sprite
based graphics routines)

As for time, if I'm going to get this BadC stuff working, I cannot really
write much code for fVDI...

> >Adding the above to the VDI would be nice. I would guess that blits are

> How about: wind_update(BEG_UPDATE) ;-)

well yea, there is that. :-)

> That works just fine under MultiTOS etc.

Hehehe. Why do I always forget about that call? I was actually thinking
about the proposed singletasking mode, but this is definately nicer. :)

> Anyway, I think there should be a way to get at a private screen, since
> games often need double buffering. The actual drawing operations in fVDI

Yea.

I guess thats Magic, N.AES, oAESis, XaAES, and maybe AES 4.1?

> action game to run in a non-topped window). Some new mechanism to get at
> keyboard/joystick/mouse input might be needed, though.

Yea...

> Perhaps we should take a look at DirectX?

Perhaps. I haven't actually looked that the API myself, but I have heard
a lot of critism of the 3D api for ease of use, so I wouldn't bet on any
of it being any different...

> Also, fDI is fully reentrant (and will later on be callable without using

Bit of trivia ... ;-)

Iconification or lack thereof under MagiC would not cause any problems
but the gadget to send the window into the background might. This is
because MagiC handles it automatically unless your application
specifically takes over control of it. In effect, a game which thinks
it is running in the foreground might suddenly find itself covered by
other windows and be oblivious to the fact.

Changing the subject away from compatibility for a moment (I think I'm
allowed, I started this thread <g>), why do you not use hardware
scrolling? It's the same on ST and ST(e) isn't it? And for all I know
the Falcon low-rez might be laid out the same anyway?

PS. I've got bigger bottles this weekend - some might even refer to
them as cans! ;-)

What about emulating ST low with the vdi (or any rez for that matter
but we'll stick with lowrez for now)?

I'll elaborate ...

STOS writes to what it thinks is a low rez screen but this is in fact
a vdi memory block which has been described to the vdi exactly as a
low rez screen is layed out. The vdi then gets the job of translating
this into whatever applies to the screen of the machine in question.
Exactly *what* the machine in question does with this is up to it - it
could blit it to a 320x200 area on the physical screen or do something
more elaborate.

For various reasons we all agree STOS and Gem don't mix so why bother
arguing about it? Why not leave STOS oblivious to the fact and let the
horsepower of the host machine do the donkey work? Let the host
machine run the Gem application. Make this "stos" Gem application
supply STOS with the memory it needs for its screens and make the Gem
application responsible for producing the screen output from those
screens.

Okay, so this is not possible in practice *but* provided there is
enough power in the host machine then it could be if someone were to
write such a Gem application.

Assuming the above, then what I've suggested is the easy part. The

hard part would be for the Gem application to get at information it requires and to prevent STOS making machine specific calls. This would require an STOS extention, preferably where STOS only makes info available to the Gem application, not where STOS has to obtain information in return.

All in all though, if it could be done, then it would affect STOS (and its programmers) not a bit (which is important for lower spec machines like the ST) as they can carry on ignoring Gem but we (Royal 'we', I've got an STE) get to play all the games we couldn't before!

Heck. It *might* even allow 256 colour sprites without Tony having to write a line of code for them. All the host machine need do when it sees a 16 colour sprite is replace it with its 256 colour equivilent!

>> For example:
>> - Reduced bitplane drawing
>> - Masked blitting
>> - Multiple blits
>
>For anyone who doesn't know, all of these optimisations are used in The
>Missing Link (STOS extension).
>
>> Comments or suggestions, anyone?

Yeah, I once made a half-hearted attempt at a mono Tetris type game in C on my STFM. Nothing came of it (it flickered like hell) except that the flickering made me realise there was a dire need to write some offscreen vdi routines. I never went back to the game but I did complete those routines, and made them so they worked in all three ST screen modes. I'm certain they run on any screen and 95% certain they'll run with any colour depth.

I'm willing to post these routines if I can be convinced of the remaining 5% which would require me cobbling up a test program. Is someone prepared to prepare a resource file with a 256 colour icon in it? If so, make it thus ...

WHITE G_BOX as the ROOT
256 colour icon as object index 1
16 colour equivilent or it as object index 2

All I plan to do is draw it with objc_draw() then have my routines grab it off the screen, invert it offscreen, then dump it back. If the colour depth is wrong then it'll screw up right?

Such a routine will be short enough to post here for everybody to try.

How could I ? I had to rearrange all my hardware to connect one of my STs
to my TV set. I do it on some rare occasions, but never had your games
lying around to try. Maybe you should send me a selection of them ? ;-)
So that next time the latter is not the case anymore. Where can I down-
load them ?

Cheers Peter

> ha!, try sticking 30 320x200 screens together and see what you get :)

Let's see. 30 times ST-Low, that's 5 times ST-Low in x and 6 times ST-Low in y direction. 5 * 6 tiles is 30 tiles, each covering a 320x200 area. That is 5 * 320 in x, gives 1600, while 6 * 200 in y, gives 1200 pixels. In total 1600x1200 is required. That is not really a problem for my Matrox Millennium, even though True-Colour is not possible anymore, I must go back to 65536 colours. But I'd just need to stick a bit more wRAM onto it to have True-Colour in that resolution too. Gives you whole Heartland without scrolling. :-))

ICONIFY is one of the few extensions that you can use in all programs without
checking for TOS versions. It's simply ignored by all older TOS versions.

Why not ? Why is everybody here against "graceful degradation", which is one of the basic principles of portable programming ? Why not converting all 256 colour graphics into 16 colour ones at program start ? There are good dithering algorithms around, what they achieve that only little worse the constructing with 16 colours in the first place. This holds particularly if the original 256 colours graphics were created with this in mind.

Sure it's a bit more work, but is the capability of running on so much more machines rewarding enough ?

Cheers Peter

Why not ? The Atari features several mechanisms that you can use to built whatever timing you want into your software.

>> Since then at least, switching video modes via Setscreen, or inquiring
>> video modes and screen addresses by XBios means is a no-no, i.e. to be
>
> Yes, I agree that Atari said to do, but they didn't really give much choice!

It wasn't really dictated by Atari. It was dictated by the hardware develop-
ments, and Atari's statement on that was only a sensible reaction to those.

>> It can all be done in a 100 % portable way by using VDI, so it's that
>> what is pretty much a must for portable programming. Pity that so many
>> people here have a personal dislike for it, especially as it's really
>> powerful.
>
> So powerful you cannot even request that the machine changes video mode.

That's been a minor design flaw that can easily be changed. AFAIK is HAS BEENhas
beenchanged already with recent NVDI.

BTW I find it seldomly desirable to have any software change resolution. It
should better adapt to the resolution it finds, or run in a window.

> If a machine supports 16-bit graphics, shouldn't a game be able to request
> that the machine use that mode?

Not really. Depends on what you mean by "request". IMHO the game should not
change video modes on it's own.

The better situation IMHO would be asking the user to change the video mode,
and if the user refuses to do so, gracefully running in the less desirable
(from the game's point of view) video mode. Sure the game might not be as
nice anymore, but the user's decision should be respected.

If some vital point REQUIRES a better video mode, sure the game may refuse
to run (but must tell so and leave properly then) if the user refused to
change video modes.

>> > Yea, so it should WORK AS DEFINED FOR THE ST.
>>
>> The problem is it CAN'T.
>
> If the machine can display ST Low, then it should be able to use setscreen
> to change into it. If it doesn't, then the program wont work, as it clearly

You really think so ??? Remember Johan Klockars

> On my 1008x608x4bit screen there's room for a lot of ST-low games at once.

This would work indeed if the games would run in windows, and used VDI.
But any setting of video mode by the game on it's own screws up the lot.

> requires ST compatible resolutions, but that isn't the programs support - if
> the machine cannot do what an ST can do, users should EXPECT games designed
> for the ST not to work.

Why design such games in the first place ? The Atari world is a lot bigger
nowadays (in terms of different models), and it's far from impossible to
design games such that they run on most if not all models.

>> keeps the screen buffer on the card and not main memory, there IS NO WAY

>
> Why not? you can write to video memory on the PC, so Physbase could easily
> just return the address that the video ram is mapped to. Of course, moving
> the physbase could be problematical.

Have you ever worked out how writing into a card's memory works on a PC ?
Why would every piece of hardware for PCs come with drivers ?

A video card's memory is not necessarily mapped into the CPU's address space !
So the simple scheme of writing into the memory by CPU write instructions
does not work.

Additionally, you cannot rely on any organisation of pixels in the memory.
Take just ST-Low as an example. The way the screen memory is organised in
ST-Low is most unusual.

>> BTW You refuse to read :
>>
>> >> "It is maintained fo backward compatibility with existing ST programs only.

>> ward compatibility" really means.
>
> Well its not compatible if its not supported... surely you aren't saying that
> its ok to drop OS calls as and when you want to, and still call it compatible?

It is an *attempt* to keep it compatible. How well an existing program works with it depends on how it uses these calls. If the program relies on everything to work like in a ST, then it won't work anymore, because it can't. With newer video hardware 100 % compatibility is impossible.

It merely means the OS has done it's best to ensure compatibility. If the program now really relies on everything to work like in a ST, then it is it's own fault, and not the OS's. This is why I said in that case the program must be considered broken.

> If, say, Super()/Supexec() was removed from user programs (as has been
> suggested!) under a multiuser environment, would you still call it TOS
> compatible, even though many (most) programs would no longer work?

That's not the point, there is no hardware dictated need to make Super() Supexec() incompatible, or even remove them entirely.

But it's all up to the vendor. An OS changes with time. This means the mere meaning of "compatibility with that OS" changes too. If Atari had not ceased to exist, and proceeded on the way to a secure multitasking OS, they'd eventually come up with a system (OS) where Super() and Supexec() would not really switch to super mode anymore. They had the right to call this OS still TOS, and a lot of nowadays software were not TOS compatible anymore. The term compatibility is not a static one !

>> So you'd better make your software deal with a variety of resolutions.
>
> Why? this adds an extra variable to a game which can make it play incorrectly.
> Next you'll be telling me that all games should make use of dithering in
> mono.

Yep. The art of programming is controlling all those variables such that they DO play correctly. And don't say dithering is too slow. You cannot know if I got a 100 MHz 68060 in my machine !

Of course you can say the few users that will gain from it are not worth the effort. That's your own decision of course. But don't tell others to decide the same way !!! You should not assume that others are not ready to spend the work just because you're not.

Cheers Peter

Nobody said you should do it with the original VDI ! There is NVDI which
is a hell faster. And there is the upcoming and promising fVDI project by
Johan Klockars. It is possible to write arcade games with NVDI, and it should
be possible with fVDI too, if it holds what Johan promises.

Would like to know what I've got to do with Falcons. You're admitting clearly
here that you jumped into this threaded with hardly having read more than
five messages. Go back and read all the thread, then let's talk again. Until

then, I leave your rubbish uncommented.

> If you could actually be bothered to do any programming,

If you mentioned the word "game" in this sentence, it would make a little bit of sense, just a bit. But the way it's there, I find this the most ridicolous line I've ever read in Usenet, hahahahahahaha.

Go on if you really wanna make a fool of yourself.

> wouldn't be that difficult to patch the operating system so that when it
> receives a request for a mode your computer can no longer do, it just
> emulates it instead.

You'd be surprised. I did something very similar.

> Oh, and don't anyone think about the usual trick of accusing me of reading
> between the lines, or answering a question that isn't there. I've been
> reading this newsgroup for ages now,

They how comes that you missed most of this thread ?

> subject heading C compiler??????). If i've misunderstood anyone's meaning
> then I strongly suggest you practice expressing yourselves a LOT more
> clearly,

I should not judge my own capabilities, but quite a few people on c.s.a.s. appreciated some "well written" (as they said) mini tutorials by me. Looks as if rather you are not capable of understanding what I write, than my writing not being well worded.

Cheers Peter

PS.: Apologies to anyone (except Andrew Gower) who feels bored by this. But
I felt unable to leave this entirely uncommented. Tony, it's not quite
this what you call a heated debate, is it ? ;-)

But in real life (i.e. face to face) it's safer as it's easier to understand
how words are meant. On Usenet you gotta rely on smilies, which are easily
forgotten. Also I for one tend to ignore smilies more or less because in the
recent years there has been a huge inflation in their use, i.e. excessive use
of them, which means they've become pretty meaningless.

Also if someone misunderstands something and starts flaming, he might have
no chance to rectify it, if his computer breaks, or the ISP goes crazy etc.
IMHO Usenet is too unreliable for risking a reputation.

Cheers Peter

> used them,

Hahaha, Guy did you think by using the term "programmer" Atari referred to you ? They've meant their own programmers of course, programmers of the AES. The word "reserved" should tell enough, shouldn't it ? It doesn't make any sense to "reserve" flags for the applications programmer, the user won't be tempted to use it ! So take it for granted that if the word "reserved" is used, the item in question is reserved for the vendor himself.

Concerning OBJECT data, the only bit a programmer is allowed to use freely is the upper byte of ob_type. You can put your flags there.

Cheers Peter

> 16 colour equivilent or it as object index 2

bad idea !
256 colours icons don't display correctly
in truecolor mode on Falcon Tos !!!
if you want to know the structure of video
memories on different machines/cards it's
not difficult,there is Atari and Non-atari,
atari modes are bit-planed and others
are not...for example 16 colors on video
cards (specktrum,etc...) is organised 2
pixels per byte, and like any PC cards
the truecolor modes are ordered B/V/R
then,all the rest is easy,the only thing
to really take care is the palette order,
but everyone knows how to translate
Vdi index into Hard index, don't you ??
if you want more , just mail me ;-)

Well I don't think NVDI is the answer for 2 reasons. a) It take up a sizeable proportion of memory on the ST, and secondly, (unless I'm mistaken.) doesn't it cost quite a lot of money? It would hardly be ideal that anyone wanting to play that particular game has to fork out huge amounts of money first to get the upgrade. The fVDI does sound very promising though. How expensive is it likely to be though? I really can't afford to be forking out large dollops of money, poor student that I am :-). (If this issue has already been raised I apologise, my memory is terrible, and I don't want to have to read about 200 messages again just to find out :-)

No, I really have read all the messages my news-server would give to me. Obviously the really old ones have expired, which is a bit inconveniant. I've just quickly re-read all your messages now, and I still can't work out what you

have to do with falcons though!, do you have any cool projects on the go at the moment? It is apparent that you know quite a lot about them :-)

> If you mentioned the word "game" in this sentence, it would make a little

Yes, when I re-read my message after sending it I was a bit shocked that, that line had been left in! I meant to take it out - honest :-) It's quite obviously not true, so I hope you weren't too insulted :-) I was just getting a bit upset that people were becoming rather insulting towards tony, and his programs, and he IS a really good programmer too. :-)

> You'd be surprised. I did something very similar.
>

You mean I'd be suprised that is would be quite difficult? I can't see why it should be that hard, after all on the ST there was an excellent little program called sebra which could emulate a monochrome screen on a colour monitor. I thought this would be much harder to do, as you're emulating a resolution of a HIGHER detail than the one you're really in, so you have to use clever dithering, and you haven't got lots of spare CPU power to do it in, like you would on a falcon emulting an ST screen.

Surely all the falcon would have to do is install an interrupt which runs a certain number of times a second, and each time looks at physbase to find out where the ST thinks the screen is, and then just convert and copy it to the real falcon screen. You can override any resoultion switches the program makes which you don't want, just by making patches to the x-bios. If the program starts writing directly to video-registers you may be in trouble, but I doubt STOS programs do that. How much of this sort of thing did the 'backwards' emulator do anyway? I assume you can't use this as it still relies on the computer supporting st-low ?

> They how comes that you missed most of this thread ?

I didn't, I've just got a terrible memory. :-)

> PS.: Apologies to anyone (except Andrew Gower) who feels bored by this. But
> I felt unable to leave this entirely uncommented. Tony, it's not quite
> this what you call a heated debate, is it ? ;-)

Is this a little knock at me by any chance? Ok so I admit one of my lines wasn't very nice, and I was shocked as you were when I realised I'd left it in, but what was wrong with the rest of my message? I even made some suggestions as how to try and improve compatability issues, so I thought I was contributing. :-(

BTW: Does anyone know if any java applet viewers have been written for the atari range of computers? And how fast are they? Java seems rather slow even on my PC,

although with each new version things improve. Java's looking like it might be the next big thing, if it's supported well on the atari, the fact that it is platform independant means you could potentially have a whole load of new software coming out once more. I am currently engaged in writing java games, and I'd love to see how they work on other computers, java currently has a lot of the same problems with VDI, in that it is a bit slow for games writing, but it's what I'm getting paid to do. :-)

I don't think the problem is that you haven't looked at the games, but rather the factthat you passed judgement on them (to a certain extent) without

trying them first. :-)

Try the URL which is at the bottom of all of tony's messages :-)
Then click on STOSSER software, then downloads.

Andrew

Well, for one thing (minor point), if you are sitting on a TT, Falcon, or
whatever with a VGA monitor, its 70vbl's per sec, unlike the 50/60 you get
on an ST - so if the game is running at 1vbl then you could potentially be
playing a game that is running 40% faster than it should be.

Also, in general, the higher the resolution, the slower the machine gets. So,
how do you know if the machine is fast enough to cope with the game at the
"intended" speed?

It was their failure to provide a generic call in the ST that has caused this
problem. However, they then made another mistake by not creating such a
generic routine in the TT or the Falcon - each time they tied the video
mode selection down to the specific hardware, which means that there is no
standard method across machines.

> That's been a minor design flaw that can easily be changed.

"Minor design flaw" that is the a major part of the subject of this thread?

> AFAIK is HAS
> BEENhas beenchanged already with recent NVDI.

Please tell me what call to use then. As I mentioned in another post,
I couldn't
find this call in the NVDI Programming docs, so if you can shed some light
on this I would be very grateful.

> BTW I find it seldomly desirable to have any software change resolution. It

> should better adapt to the resolution it finds, or run in a window.

I disagree completely.

If I want to play an arcade game, I dont want it running in a small window
in the top-left corner of the screen (or whatever), I want it full-screen
no distractions. Find my someone who likes playing Quake no the PC in a window
- you certainly wont find many who dont play full-screen.

Equally, its hassle for me as a user to be TOLD to change resolution by
a program, when I know full well that it is capable of doing it for itself.

> > If a machine supports 16-bit graphics, shouldn't a game be able to request
> > that the machine use that mode?
>
> Not really. Depends on what you mean by "request". IMHO the game should not
> change video modes on it's own.

This is where we disagree.

> The better situation IMHO would be asking the user to change the video mode,
> and if the user refuses to do so, gracefully running in the less desirable
> (from the game's point of view) video mode. Sure the game might not be as
> nice anymore, but the user's decision should be respected.

This seems a very strange way of doing it... IMO not what the games-playing
public want.

> > If the machine can display ST Low, then it should be able to use setscreen
> > to change into it. If it doesn't, then the program wont work, as it clearly
>
> You really think so ??? Remember Johan Klockars

Did you finish this? Anyway... yes, I do think that setscreen() should be
made to work if the machine can do it. It would be quite possible to make a
little patch to store the current mode somewhere else, and the screenmode
being restored to reset it to the mode it was in before.

> > On my 1008x608x4bit screen there's room for a lot of ST-low games at once.
>
> This would work indeed if the games would run in windows, and used VDI.
> But any setting of video mode by the game on it's own screws up the lot.

But then, would anyone actually try and PLAY that many games at once? The
answer is of course no, you would only want to play one game at a time,
so why have it only taking up 1/9th of your screen, with the rest displaying
the desktop?

> > requires ST compatible resolutions, but that isn't the programs support - if

>
> Why design such games in the first place ? The Atari world is a lot bigger

> nowadays (in terms of different models), and it's far from impossible to
> design games such that they run on most if not all models.

Yea, but the "most if not all" models are the low end STs, on which many
of these games are developed! No games programmer is going to write games
which they cannot run on their own machines.

> > Why not? you can write to video memory on the PC, so Physbase could easily

>
> Have you ever worked out how writing into a card's memory works on a PC ?
> Why would every piece of hardware for PCs come with drivers ?

Well, there is this thing called standardisation, and it exists on the PC...
Yes, they all come with drivers - but these are principally for driving
the acceleration logic that is on the cards nowadays rather than changing
video mode - they all use a standard (VESA 1.2 or 2) which means that any
program can ask what the graphics card is capable of, and switch into the
closest mode to what is requested.

> A video card's memory is not necessarily mapped into the CPU's address space !
> So the simple scheme of writing into the memory by CPU write instructions
> does not work.

Well, that certainly works on the NOVA (if Bad Mood is anything to go by).

> Additionally, you cannot rely on any organisation of pixels in the memory.
> Take just ST-Low as an example. The way the screen memory is organised in
> ST-Low is most unusual.

Yes, it is, which is why I keep saying "if possible". If the machine supports
ST-Low, then it should be possible to request it.

> It merely means the OS has done it's best to ensure compatibility. If the
> program now really relies on everything to work like in a ST, then it is it's
> own fault, and not the OS's. This is why I said in that case the program must
> be considered broken.

I'm sorry, but I can see this when it comes to directly accessing the hardware
etc. but when simply calling an OS call? I dont think you can blame a program
for using an OS call, when the only other mechanism for doing what it wants
is to directly access the hardware. Now, if there were another OS call that
was more appropriate, then yes, I would agree - but there isn't (except for
this possible NVDI one, which certainly is not well documented, and is from
after Atari left us).

> > If, say, Super()/Supexec() was removed from user programs (as has been
>
> That's not the point, there is no hardware dictated need to make Super()
> Supexec() incompatible, or even remove them entirely.

But on a machine that is capable of displaying ST-Low, there is no need

to break setscreen() either. If the hardware vendor has made the decision
not to provide ST-low compatibility, then you could take it up with them.

> But it's all up to the vendor. An OS changes with time. This means the mere
> meaning of "compatibility with that OS" changes too. If Atari had not ceased

> compatibility is not a static one !

I take your point, but then, if this stable-m/t'ing OS were not retro-fitted
to STs, people would STILL be making software for the ST, and people would
be complaining as you are right now that it wouldn't work on their machines.
Well, tough, is all I would say to those people... if software developed and
designed on a low end machine doesn't run, then go and buy the programmer
a new super-duper flash computer instead of complaining.

> Yep. The art of programming is controlling all those variables such that they
> DO play correctly. And don't say dithering is too slow. You cannot know if
> I got a 100 MHz 68060 in my machine !

Yea, and someone with a 1040st with a SM-124 is going to be happy? Most
STOS games are developed on a plain ST[e], remember...

> Of course you can say the few users that will gain from it are not worth the
> effort. That's your own decision of course. But don't tell others to decide

> work just because you're not.

Oh, I'm not the one advocating that you change the way you program... thats
you, telling Tony to switch to using the VDI, which will not benefit him one
iota, appart from making you happy...

Its fine with me if people want to write VDI based games, but people who
choose not to should not be "attacked" (too strong a word, I know... I just
cannot think of the right word atm...) for this.

If Hades/Medusa/Milan owners want games that make use of their systems,
then they should consider writing them themselves, rather than expecting
people with a bottom of the range ST to write them...

What fix is that? Something other than folderxxx.prg? Because the 40folder bug really gets you fast with CAB. I imagine that a TOS1.04 machine only delays the problem.

1) Does a version of wdialog exist in english, and where can it be gotten?
2) Does a version of the files, possibly including the sample files exist in english?
   Any help will be appreciated

Boris

why should I be ashamed? how can you be shure that this book (I assume it is a book) can be found in Sweden where I live, and Why should I ahve bought it, even if it does exist?

Instead of giving me "poiters" of where to look, Why not be helpfull and tell me what that book says.....

If anyone wants to try it out, fVDI v0.80 has now been released.
I've included both a monochrome and a four plane device driver, but the
latter is _very_ slow (everything but lines and solid fills are done pixel
by pixel).

As I've said before, the current code is mainly written for the '040, so
don't expect the best possible speed on normal Atari machines even for
things like blitting and filling.
Text drawing is done via internal calls to vrt_cpyfm (the routine that's
used to draw monochrome images) and is therefore a lot slower than it will
be when real font support is added.
Naturally, many things are still not supported, but most things I've tried
actually work well. Please, let me know what you find out.

I would be interested in some performance numbers (monochrome) from users
of more ordinary machines than my Falcon+AB040.

>upgrade. The fVDI does sound very promising though. How expensive is it likely to
>be though? I really can't afford to be forking out large dollops of money, poor

Like all software I write in my free time, fVDI is FreeWare.
It's possible, however, that third party device drivers (if any ever
are written) will cost money.

Introduction

This is a series of articles about writing
games for the Atari ST in C. The articles
were posted by Hans Wessels in the newsgroup
comp.sys.atari.programmer
Back issues are available at:
www.dejanews.com
Planned number of articles: CLASSIFIED
Release date of next article: CLASSIFIED

Getting started

First off all you need a ANSI C compiler,
secondly some experience with your C compiler.
You should a least have compiled and executed
the 'hello world' program when you start with
this series.

C is an excelent language to write portable
programs but as this is exactly what we are
NOT going to do, some modifications of the
source code might be necessarry to get the
program working on an other C compiler as the
Pure C 1.1 compiler I am using for this series.
To make everything as compiler independent as
possible I tried to handle all compiler
specifics in the include file 'general.h'.
Project files are also very compiler specific,
it is assumed that you know how to make a
project file for the C compiler you are using.

Further this is not a course in writing very
portable and resolution independent programs.
The targert is to make an arcade game running
in ST low on an Atari ST. This means that most
routines are written for a 320 x 200 display
with 4 interleaved bitplanes. But most routines
should easily be adapted to an other resolution
with a different number of bitplanes (for example
TT medium or TT low). You will have to start all
over again if you want to code for a graphics
mode without bitplanes (for example Falcon
high color).

GENERAL.H

The include file 'general.h' is at this moment:
file: general.h
----------->8----------

```
/* some general definitions */

#ifndef GENERAL_H__
#define GENERAL_H__

#include <tos.h>

/* bytes words and longwords */
typedef unsigned char      uint8;
typedef unsigned short int uint16;
typedef unsigned long int  uint32;

typedef signed char      int8;
typedef signed short int int16;
typedef signed long int  int32;

/* special functions */
void move_sr(int16 value) 0x46c0; /* move D0,SR */

#endif
```

---------->8----------

The headerfile 'tos.h' is included. This header file contains all OS specific variables and routines, as long as it isn't a part of the VDI and AES.
The typedefs are to get signed and unsigned 8, 16 and 32 bit integers. ANSI C specifies only the minimum number of bits for integers. With these typedefs I make sure everybody (especially C compilers) knows what I am talking about when I say uint16. As far as I know all Atari C compilers will generate variables with the right size when I use these typedefs. Note the on some Atari C compilers the size of an int is 16 bits (Pure C) and on some others 32 bits (GNU C).

The function
void move_sr(int16 value) 0x46c0;
is in Pure C an assembly inline fuction moving the argument in D0 to the processor's status register. On systems without an inline possibility like this the function can be replaced by it's assembley equvalent:

```
; move_sr(int16 value)

EXPORT move_sr     ; make this label extern

move_sr:
     move  D0,SR
     rts
```

The function is used to disable the interrupts when manipulating interrupt routines and/or vectors. The

function can be omitted but this might result in a program that crashes so now end then.

Getting player input

The most important part of an arcade game is interaction with the player. So I will start with some routines to read the keyboard and joysticks. All this work is done in 'joystick.c'.

file: joystick.c

```
--------------->8-----------------------------
#include <stdio.h>

#include "general.h"
#include "joystick.h"

key_handler_info key_info;
static void *old_kbd;

void key_handle(void);

void init_keyboard(int mouse)
{
  Bconout(4, 0x13); /* stop data transfer */
  Vsync();
  Vsync();
  Vsync(); /* Voodoo code */
  { /* flush keyboard */
    uint8 *p=(uint8 *)0xfffffc00UL;
    move_sr(0x2700);
    while(*p&1)
    {
      uint8 tmp=p[2];
      (void) tmp;
    }
  }
  { /* install routines */
    KBDVBASE *base;
    base=Kbdvbase();
    old_kbd=base->kb_kbdsys;
    base->kb_kbdsys=key_handle;
    move_sr(0x2300);
  }
  if(mouse==0)
  { /* disable mouse, enable joystick */
    Bconout(4, 0x14);
  }
  else
  {
    Bconout(4, 0x08); /* enable mouse */
  }
  Vsync();
```

```
  Vsync();
  Vsync();
}

void restore_keyboard(void)
{
  Bconout(4, 0x13); /* stop data transfer */
  Vsync();
  Vsync();
  Vsync(); /* Voodoo code */
  { /* flush keyboard */
    uint8 *p=(uint8 *)0xfffffc00UL;
    move_sr(0x2700);
    while(*p&1)
    {
      uint8 tmp=p[2];
      (void) tmp;
    }
  }
  { /* restore keyboard */
    KBDVBASE *base;
    base=Kbdvbase();
    base->kb_kbdsys=old_kbd;
    move_sr(0x2300);
  }
  Bconout(4, 0x08); /* enable mouse */
  Vsync();
  Vsync();
  Vsync();
}

void key_handle(void)
{
  uint8 key;
  key=*(uint8*)0xfffffc02UL;
  if(key_info.status==0)
  {
    switch(key)
    {
      case 0xff:
      key_info.status=-1; /* joy 1 is comming */
      break;
      case 0xfe:
      key_info.status=1;  /* joy 0 is comming */

      case 0xf8:
      key_info.buttons=0; /* no mouse buttons */
      key_info.status=3; /* mouse packet is comming */
      break;
      case 0xf9:
      key_info.buttons=1; /* mouse buttons */
      key_info.status=3; /* mouse packet is comming */
      break;
```

```
    case 0xfa:
    key_info.buttons=2; /* mouse muis buttons */
    key_info.status=3; /* mouse packet is comming */
    break;
    case 0xfb:
    key_info.buttons=3; /* mouse muis buttons */
    key_info.status=3; /* mouse packet is comming */
    break;
    case 72: /* cursor up */
    key_info.joy2|=JOY_UP;
    break;
    case 72+128:
    key_info.joy2&=~JOY_UP;
    break;
    case 75: /* cursor left */
    key_info.joy2|=JOY_LEFT;
    break;
    case 75+128:
    key_info.joy2&=~JOY_LEFT;
    break;
    case 77: /* cursor right */
    key_info.joy2|=JOY_RIGHT;
    break;
    case 77+128:
    key_info.joy2&=~JOY_RIGHT;
    break;
    case 80: /* cursor down */
    key_info.joy2|=JOY_DOWN;
    break;
    case 80+128:
    key_info.joy2&=~JOY_DOWN;
    break;
    case 57: /* space */
    key_info.joy2|=JOY_FIRE;
    break;
    case 57+128:
    key_info.joy2&=~JOY_FIRE;
    break;
    default:
    key_info.last_key=key;
    break;
  }
}
else
{
  if(key_info.status<0)
  { /* joy1 */
    key_info.joy1=key;
    key_info.status=0;
  }
  else
  {
    if(key_info.status==1)
```

```
      { /* joy0 */
        key_info.joy0=key;
        key_info.status=0;
      }
      else
      {
        if(key_info.status==2)
        { /* mouse y */
          key_info.status=0;
          key_info.mousey+=(signed char)key;
        }
        else
        { /* mouse x */
          key_info.status=2;
          key_info.mousex+=(signed char)key;
        }
      }
    }
  }
}
---------------->8-----------------------------
```

There are three functions in this file. The first,
void init_keyboard(int mouse);
initializes our own keyboard hanler. The parameter
'int mouse' indentifies whether wil will use 2
joystick inputs (mouse==0) or joystick and mouse
(mouse!=0).
First the routine disables all keyboard output.
The Vsync()s create a delay that should be long
enhough to complete the Bconout.
Then the interrupts are disabled and data is
being read from the keyboard until no more
packets are send.
Then the new keyboard handler is installed in the
keyboard vector. The old vector is saved.
As last the routine enables the keyboard output by
enable either the mouse or joystick mode.

The installed function key_handle() is now called by
the OS every time a keyboard packed arrives. The routine
reads the data directly from the ACIA data register. The
key_info.status determines what to do with the data:
 0: a new packed is received
    if the packet is a normal scan code the scancode
    is stored in key_info.last_key. The scancodes of the
    cursor keys and the space bar are used to emulate
    a keyboard joystick, called joy2.
    Mouse and joystick announce packets change the
    key_info.status into the appropiate value.
-1: a joystick 1 packed is comming
 1: a joystick 0 packed is comming
 2: mouse y info is comming

```
 3: mouse x info is comming
```

The last function restore_keyboard restores the original keyboard vector the same way as init_keyboard changed it to our own.

The headerfile that comes with this C file defines the external interface of the routines.

file: joystick.h

```
--------------->8-----------------------------
/* interface to joystick.c */

#ifndef JOYSTICK_H__
#define JOYSTICK_H__

#define JOY_UP 1
#define JOY_LEFT 4
#define JOY_RIGHT 8
#define JOY_DOWN 2
#define JOY_FIRE 128

/* key handeler info */
typedef struct
{
  volatile uint8 joy0;
  volatile uint8 joy1;
  volatile uint8 joy2; /* cursor joystick */
  volatile uint8 last_key;
  volatile int mousex;
  volatile int mousey;
  volatile uint8 buttons; /* muis knoppen */
  int status;
} key_handler_info;

extern key_handler_info key_info;

/* functions */
void init_keyboard(int mouse);
void restore_keyboard(void);

#endif
--------------->8-----------------------------
```

The values for joystic up, down, left and right are defined, the key_handler_info struct is defined and the prototype of the external keyboard functions is here.

The only thing missing is a program to test the routines:
file: game0.c

```
--------------->8-----------------------------
/* game0.c, the game routines */

#include <stdio.h>

#include "general.h"
#include "joystick.h"

#define MOUSEMODE 0     /* 0=2 joystick, 1= mouse and joystick */

void main_game(void);
void read_kbd(void);

int main(void)
{
  Supexec((long)(main_game));
  return 0;
}

static int stop=0;

void main_game(void)
{
  init_keyboard(MOUSEMODE);
  for(;;)
  {
    read_kbd();
    if(stop)
    {
      break;
    }
  }
  restore_keyboard();
}

void read_kbd(void)
{
  #if MOUSEMODE
  printf("Mouse x: %05i  Mouse y: %05i   Buttons: %02i\r",
          key_info.mousex, key_info.mousey, key_info.buttons);
  #else
  printf("joy0: %02X    joy1: %02X    joy2: %02X    key: %02X\r",
          key_info.joy0, key_info.joy1, key_info.joy2,
key_info.last_key);
  #endif
  if(key_info.last_key==1)
  { /* Escape key pressed? */
    stop=1;
  }
}
--------------->8-----------------------------
```

This C file includes both headerfiles we made. The only thing the main routine does is executing the function

main_game() in supervisor mode.
The function main_game() first installs the keyboard routines. The macro MOUSEMODE defines whether the keyboard routines are installed in mouse or joystick mode.
Then comes a endless loop calling the function read_kbd().
If the (global) variable stops becomes true (1) the loop is exited by a break. The original keyboard routine is restored and the function finishes.
The function read_kbd prints the values in the key_info struct. Now you can see what happens to the key_info variables by pressing keys and moving the joysticks.
The variable stop is set to one by pressing the escape key (==scancode 1).

Last but not least the project file I used:
file: game.prj

```
---------------->8-----------------------------
; game.prj

game.tos           ; name of executable program
.C [ -Y ]
.L [ -L -Y ]
.S [ -Y ]
=                  ; list of modules follows...

e:\pc\lib\original\PCSTART.s ; startup code

game0.c            (general.h, joystick.h)
joystick.c         (general.h, joystick.h)

PCFLTLIB.LIB       ; floating point library
PCSTDLIB.LIB       ; standard library

PCEXTLIB.LIB       ; extended library
PCTOSLIB.LIB       ; TOS library
PCGEMLIB.LIB       ; AES and VDI library
---------------->8-----------------------------
```

Have fun with trying this code.

Making a game

Now we have some working keyboard routines. Let's try them in a little game. Because we haven't any graphics routines yet we'll use the OS to display some graphics. We will do it the clean way using the VDI.

file: plotrout.c

```
--------------->8-----------------------------
/* plot routines */

#include <vdi.h>
#include <aes.h>
#include <stdlib.h>

void do_exit(void);

int
  work_in[] = { 1,1,1,1,1,1,1,1,1,1,2 },
  work_out[57],
  gr_handle,
  clippts[] = { 0,0,639,399 };  /* clipping rectangle */

GRECT
  desk;

void cls(void)
{
  v_clrwk(gr_handle);
}

void line(int x1, int y1, int x2, int y2, int color)
{
  int array[4];
  array[0] = x1;
  array[1] = y1;
  array[2] = x2;
  array[3] = y2;
  vsl_color(gr_handle, color);
  v_pline(gr_handle, 2, array);
}

void getwindow(int *x, int *y, int *w, int *h)
{
  *x=clippts[0];
  *y=clippts[1];
  *w=clippts[2];
  *h=clippts[3];
}

void setpixel(int x, int y, int color)
```

```
{
  int array[2];
  array[0] = x;
  array[1] = y;
  vsm_color(gr_handle, color);
  v_pmarker(gr_handle, 1, array);
}

int getpixel(int x, int y)
{
  int pel, index;
  v_get_pixel(gr_handle, x, y, &pel, &index);
  return index;
}

void init_plotrout(void)
{
  appl_init();
  atexit(do_exit);
  v_opnvwk(work_in, &gr_handle, work_out);
  /* set clipping and other stuff */
  /* get screen size */
  wind_get(0, WF_CURRXYWH, &desk.g_x,&desk.g_y,&desk.g_w,&desk.g_h);
  clippts[0] = desk.g_x;
  clippts[1] = desk.g_y;
  clippts[2] = desk.g_x + desk.g_w;
  clippts[3] = desk.g_y + desk.g_h;
  vs_clip(gr_handle, 1, clippts);
/* modes for following function
 * MD_REPLACE      1  Replace
 * MD_TRANS        2  Transparent
 * MD_XOR          3  Xor
 * MD_ERASE        4  Reverse Transparent
 */
  vswr_mode(gr_handle, MD_REPLACE);
  /* influences set pixel type */
  vsm_type(gr_handle, 1);     /* mark with points */
  /* influences lines */
  vsl_type(gr_handle, 1);     /* straight line */
  vsl_ends(gr_handle, 0, 0);  /* begin and end style */
  vsl_width(gr_handle, 1);    /* line width */
}

void set_mode(int mode)
{
  /* modes for following function
   * MD_REPLACE      1  Replace
   * MD_TRANS        2  Transparent
   * MD_XOR          3  Xor
   * MD_ERASE        4  Reverse Transparent
   */
  vswr_mode(gr_handle, mode);
}
```

```
void do_exit(void)
{
  appl_exit();
}
```

---------->8----------

This C file defines some usefull functions for displaying graphics. How they work can be read in any good ST programming book. We only want to use them. A short overview is given in the interface definition of the code; plotrout.h.

file: plotrout.h

---------->8----------

```
/* interface to plotroutines */

#ifndef PLOTROUT_H__
#define PLOTROUT_H__

void init_plotrout(void);
void cls(void);
void line(int x1, int y1, int x2, int y2, int color);
void setpixel(int x, int y, int color);
int getpixel(int x, int y);
void set_mode(int mode);
void getwindow(int *x, int *y, int *w, int *h);

#endif
```

---------->8----------

We now have the following functions:

```
init_plotrout(): initializes the graphics functions.
cls(): clear screen
line(x1, y1, x2, y2, color): draw a line from x1,y1 to
  x2,y2 in color color.
setpixel(x, y, color): plot a pixel at x,y in color color.
getpixel(x, y): get the pixel color at x,y.
set_mode(mode): set drawing mode:
  MD_REPLACE      1  Replace
  MD_TRANS        2  Transparent
  MD_XOR          3  Xor
  MD_ERASE        4  Reverse Transparent
getwindow(x, y, width, height) get the size of the screen.
```

These functions are resolution independent. You can inquire the size of the screen with get window. The routines are far from complete, but there is enough for a simple game like Tron.

file: game1.c

---------->8----------

```
/* game1.c, the game routines */
/* Tron */

#include <stdio.h>
```

```
#include "general.h"
#include "joystick.h"
#include "plotrout.h"

void main_game(void);
void read_kbd(void);

int main(void)
{
  init_plotrout();
  Supexec((long)(main_game));
  return 0;
}

void main_game(void)
{
  int sx;
  int sy;
  int sw;
  int sh;
  init_keyboard(0);
  getwindow(&sx, &sy, &sw, &sh);
  for(;;)
  {
    int stop=0;
    int p1x=sx+sw/4;
    int p1y=sy+sh/2;
    int p1dir=0;
    int p2dir=2;
    int p2x=sx+(sw*3)/4;
    int p2y=sy+sh/2;
    cls();
    /* draw playfield */
    line(sx,      sy     , sx+sw-1, sy     , 3);
    line(sx+sw-1, sy     , sx+sw-1, sy+sh-1, 3);
    line(sx+sw-1, sy+sh-1, sx     , sy+sh-1, 3);
    line(sx,      sy+sh-1, sx     , sy     , 3);
    for(;;)
    {
      if(getpixel(p1x, p1y)!=0)
      {
        fprintf(redir, "Game over! Player 2 Wins!\nPress fire to
restart.\n");
        while((JOY_FIRE & (key_info.joy0 | key_info.joy1 |
key_info.joy2))==0)
        {
          ;
        }
        break;
      }
      setpixel(p1x, p1y, 1);
      if(getpixel(p2x, p2y)!=0)
      {
```

```
        printf("Game over! Player 1 Wins!\nPress fire to restart.\n");
        while((JOY_FIRE & (key_info.joy0 | key_info.joy1 |
key_info.joy2))==0)
        {
          ;
        }
        break;
      }
      setpixel(p2x, p2y, 2);
      Vsync();
      {
        uint8 key=key_info.joy0 | key_info.joy2;
        switch(p1dir)
        {
        case 0:
        case 2:
          if(key&JOY_UP)
          {
            p1dir=3;
          }
          else
          {
            if(key&JOY_DOWN)
            {
              p1dir=1;
            }
          }
          break;
        case 1:
        case 3:
          if(key&JOY_LEFT)
          {
            p1dir=2;
          }
          else
          {
            if(key&JOY_RIGHT)
            {
              p1dir=0;
            }
          }
          break;
        }
      }
      {
        uint8 key=key_info.joy1;
        switch(p2dir)
        {
        case 0:
        case 2:
          if(key&JOY_UP)
          {
            p2dir=3;
```

```
    }
    else
    {
      if(key&JOY_DOWN)
      {
        p2dir=1;
      }
    }
    break;
  case 1:
  case 3:
    if(key&JOY_LEFT)
    {
      p2dir=2;
    }
    else
    {
      if(key&JOY_RIGHT)
      {
        p2dir=0;
      }
    }
    break;
  }
}
switch(p1dir)
{
case 0:
  p1x++;
  break;
case 1:
  p1y++;
  break;
case 2:
  p1x--;
  break;
case 3:
  p1y--;
  break;
}
switch(p2dir)
{
case 0:
  p2x++;
  break;
case 1:
  p2y++;
  break;
case 2:
  p2x--;
  break;
case 3:
  p2y--;
```

```
        break;
      }
      if(key_info.last_key==1)
      { /* Escape key pressed? */
        stop=1;
        break;
      }
    }
    if(stop)
    {
      break;
    }
  }
  restore_keyboard();
}
```

----------->8----------

In main the graphics routines are initialized and
the function main_game() is called in supervisor mode.
The function main_game() installs the keyboard routines
in joystick mode.
The size of the screen is determined.
In an endless loop (which is exited by a break when
the variable stop becomes true), the start coordinates
and directions of the two players are initialized.
The screen is cleared and the playfield is drawn in
color 3.
Then the game loop is entered. Before a pixel is plotted
on the current position of the players it is checked
whether the pixel already has been set. When this is the
case the game is finished and de winning player is printed
on the screen, pauzing the game until fire is pressed.
Then a Vsync, waiting for the next screen to be displayed.
without the Vsync the game would be too fast.
Then the new directions of the players are determined using
the values in the key_info struct.
0 is right
1 is down
2 is left
3 is up.
Player 1 can use the joystick in the mouse port or the arrow
keys. Player 2 uses the joystick in the joystick port.
After the new directions of the players is determined the
new coordinates are calculated.
Then it is checked if escape has been pressed, when this is
the case the game is stopped.
Then loop is looped.
On exit the original keyboard routines are restored.

For those who wnat to know, the project file

----------->8----------

```
; game.prj

game.tos           ; name of executable program
```

```
.C [ -Y ]
.L [ -L -Y ]
.S [ -Y ]
=                  ; list of modules follows...

e:\pc\lib\original\PCSTART.s ; startup code

game1.c            (general.h, plotrout.h, joystick.h)
plotrout.c         (general.h, plotrout.h)
joystick.c         (general.h, joystick.h)

PCFLTLIB.LIB       ; floating point library
PCSTDLIB.LIB       ; standard library

PCEXTLIB.LIB       ; extended library
PCTOSLIB.LIB       ; TOS library
PCGEMLIB.LIB       ; AES and VDI library
--------------->8-----------------------------
```

It's almost exactly the same as the privious one, only the plotrouts are added and the name of the game file is changed.

Interesting additions to this program are a smart computer player and/or the addition of more human or computer players. It is possible to add extra 'virtual' joysticks to the keyboard routines, making keyboard joysticks for extra players.

Have fun with trying this simple game.

Selecting a Programming Language Made Easy

Daniel Solomon & David Rosenblueth
Department of Computer Science, University of Waterloo
Waterloo, Ontario, Canada N2L 3G1

With such a large selection of programming languages it can be difficult to choose one for a particular project. Reading the manuals to evaluate the languages is a time consuming process. On the other hand, most people already have a fairly good idea of how various automobiles compare. So in order to assist those trying to choose a language, we have prepared a chart that matches programming languages with comparable automobiles.

{point Assembler } A Formula I race car. Very fast, but difficult to drive and expensive to maintain.

{point FORTRAN II } A Model T Ford. Once it was king of the road.

{point FORTRAN IV } A Model A Ford.

{point FORTRAN 77 } A six-cylinder Ford Fairlane with standard transmission and no seat belts.

{point COBOL } A delivery van. It's bulky and ugly, but it does the work.

{point BASIC} A second-hand Rambler with a rebuilt engine and patched upholstry. Your dad bought it for you to learn to drive. You'll ditch the car as soon as you can afford a new one.

{point PL/I } A Cadillac convertible with automatic transmission, a two- tone paint job, white-wall tires, chrome exhaust pipes, and fuzzy dice hanging in the windshield

{point C} A black Firebird, the all-macho car. Comes with optional seat belts (lint) and optional fuzz buster (escape to assembler).

{point ALGOL 60 } An Austin Mini. Boy, that's a small car.

{point Pascal } A Volkswagon Beetle. It's small but sturdy. Was once popular with intellectuals.

{point Modula II} A Volkswagon Rabbit with a trailer hitch.

{point ALGOL 68 } An Astin Martin. An impressive car, but not just anyone can drive it.

{point LISP} An electric car. It's simple but slow. Seat belts are not available.

{point PROLOG/LUCID} Prototype concept-cars.

{point Maple/MACSYMA} All-terrain vehicles.

{point FORTH} A go-cart.

{point LOGO} A kiddie's replica of a Rolls Royce. Comes with a real engine and a working horn.

{point APL} A double-decker bus. Its takes rows and columns of passengers to the same place all at the same time. But, it drives only in reverse gear, and is instrumented in Greek.

{point Ada} An army-green Mercedes-Benz staff car. Power steering, power brakes and automatic transmission are all standard. No other colors or options are available. If it's good enough for the generals, it's good enough for you. Manufacturing delays due to difficulties reading the design specification are starting to clear up.

Ehhhh.. but wasn't we talking about a pinball game now? You are quick to
change game type so that you can pick on us. :-)

Wow, so Obsession is build up of 30 320x200 screens! I didn't know that!
;-)

> >window borders taking it down to lets say, 800x540. Still plenty of room

You must have a super duper version of Obsession which I have never even
heard of. :-)

> >clone,I have now updated it and hopefully it now works on a regular ST....
>
> So eerm where is it ?

I wont tell you, but if you managed to read my signature you would find
it.
I still suspect that it might fail on ST's... :-(

Lot's of "AFAIK" here, but still noone has said how it's done, so how can people
do it when noone knows how to do it?

It; like shooting on a dead horse.

> BTW I find it seldomly desirable to have any software change resolution. It
> should better adapt to the resolution it finds, or run in a window.

This is starting to get out of hands, even for me. So you can't live with the
fact that some games are mroe playbale if they cover the whole screen in a
lower resolution? Not even I wold like to run all games in a 320x200 window
on my 1024x768 desktop. It would just be to small! Some games are fine to
run in a window but some just aint. Also shifint 1024x768 16-bit even on

the
fastest TOS clone is but much. Even most PCs will chooke.

Yes, this is one solution. Also some games on the PC have got 2 modes.
Either
full screen (a resultion change is most often necessary) or in a window.
But
in order to make this possiblen and not being forced to write 2 versions
of the
game some pwoerfull library would be needed. Maybe fVDI could handle
that as
well by adding a games library.

Isn't this how Bad Mood does it, writing directly into Video RAM on the
Nova?
I still havn't been able to test it as I can't get the damned thing to
compile
for Nova, or compile at all for that matter. :-\

Well, I would say that we would need a army of games prpgrammers. Not
just
one lone rider called Tony, even thought he try to work like a small
army
on his own. :-)

It sure would be nice if we all could cooperate. If fVDI gets usefull
for games maybe even some old STOS coders cold be persuaded to code
with it. And a good way to do a resolution change would certainly be
needed as well as an extended ent_multi() with joystick and joypad
support.

Okey, thanks. That was what I suspected but I got a bit wondering as it
did not work under STonX. I guess there is something else going on.

I'm not sure if it say waht type of game this is, but could
you make something else than a PacMan clone (if that is what
it is)? Mario has already done a very good PacMan running in
GEM window, so it would be nice without something which we
don't have right now.

Bomberman clone?
Breakout clone?
Pinball cone?
xxx clone?

>Pretty impressive. :-)

Actually, it seems my memory isn't what it should be. When I checked
a few things yesterday it turned out that while vsl_color did indeed get
clocked for one 'click' on most calls, there were a few faster calls.

I think I could increase the timer frequency, but for all useful VDI
operations it seems allright as it is, even with an '040.

>Well I have some rather braindead 8/16bpp mode stuff, although I'm sure its
>nothing you couldn't work out. I have quite a fast setpixel() routine that

It's not so much a question about whether I can work something out (which
I definitely can), as how quickly fVDI will develop if I have to write
every single line of code for it.

>that works in most planar modes (2->8).

The speed of set_pixel is, unfortunately, not very relevant for the current
fVDI since there's such a lot of overhead anyway when that is needed.
Still, it would be interesting to see if I might have missed something

in my own implementations.

>I've (sort of) got access to the TML 4bpp modes, but theses are all hard
>coded for 320x200, and are not too easy to understand (and appart from

Hard-coding is usually not difficult to remove and I think it's an
inherent characteristic of fast bitplane drawing code (especially for
multiple interleaved bitplanes) that it's difficult to understand...

>putpixel/setpixel, and various copy ops, it doesn't have any non-sprite
>based graphics routines)

Sprite drawing routines should be mostly the same as normal vro_cpyfm
(D = S mode) blitting. Perhaps with some masking added.

>As for time, if I'm going to get this BadC stuff working, I cannot really
>write much code for fVDI...

I understand that. The BadC module interface is used for the device
drivers in the current fVDI, though, so if you have any new ideas... ;-)

>> that the monochrome blitter source (which should handle all the vro_cpyfm
>> operations) is more than 30kbyte assembly as it is.
>
>hmm... yea, pretty big...

Fortunately, that includes four very similar duplicates of large parts
of the code (S = D code, generic code and shadow screen versions for all
of that).

>Yea, I remember that... Any idea how fAES is going? I dont suppose you've

The Fenix developer mailing list has been quiet for more than three
months, so I'm not sure _anything_ is happening.

>heard anything from Sven about the kernel have you?

Heard from Sven? Are you joking? ;-)

>
>I guess thats Magic, N.AES, oAESis, XaAES, and maybe AES 4.1?

I don't know about Magic or N.AES and would be surprised if Atari managed
it, but last time I looked at oAESis it seemed fine. The test version of

XaAES that I released long ago also returned quickly, but I think
something happened later on to slow things down again.

There is a small program called LINES.PRG (IIRC) that runs a _lot_ faster
with an AES that has quick evnt_multi calls. I'm not sure if it was the one
Atari included with MultiTOS or the one in the XaAES distribution, though.

>> Perhaps we should take a look at DirectX?
>
>Perhaps. I haven't actually looked that the API myself, but I have heard
>a lot of critism of the 3D api for ease of use, so I wouldn't bet on any

I don't think the other parts (DirectDraw, DirectSound etc) have received
that much criticism, but I haven't looked at them myself yet. Currently
I'm mostly looking into Win32/GDI (I intend to write a graphics test
program for the PC and Atari at the same time) and RRedline (the native
3D API for the Rendition graphics chips).

Don't agree to this. Most DOS game are on implementation technology
inferior to most Atari games. The implementation relies on brute
force power of the computer. Great games like 'No second price',
'Wings of death' and 'Enchanted land' get the maximum from the ST
hardware. DOS games more or less work.

Some of the writers of messages requesting Tony to write 256 color
games assumed the STOS routines were universal enough that a change
from 16 to 256 color sprites would be enough to create those games.
They didn't know that most of the STOS extensions only work in ST LOW.

> Then there would be decent standard that people wanting to write

Ack! I will try to design the C routines in my GPIC series to do
exactly that!

I know, Have got the C source right in front of me :-)

The resolution of the heartlan map is 8640x1600 pixels, or,
to speak in ST low screen sizes 27 screens horizontal and
8 screens vertical.

Peter Rottengatter wrote:
> Let's see. 30 times ST-Low, that's 5 times ST-Low in x and 6 times ST-Low in

> colours. But I'd just need to stick a bit more wRAM onto it to have True-
> Colour in that resolution too. Gives you whole Heartland without scrolling.
> :-))

Sorry Peter, even the milennium won't do this, the maximum horizontal
resolution of a milennium is 2000 pixels (Ok, don't know the specs by
head, could also be 3000 or even 4000, but I think it was 2000), so
there is now way you can get it on your milennium.

Bye Hans

BTW Tony: if you call Heartland fast scrolling, how would you
call a game that scrolls twice as fast? (I mean here a screen
update every vbl in stead of every second vbl.)

Might be, but I also need also a lot of RAM to debug ARJ. This
weekend I had to switch off all autofolder programs and
accessoiries to find a nasty bug. For normal runs (without
debuger) I am just on the right side of the memory limit. So
I can't spend some extra memory on thing like magic and why
should I Kaos works fine for me, it's Cab that had problems.

No! A normal ST has no harware scrolling. The only thing that comes
close is an complex scheme of opening upper left and right borders to
get the screen start on word alignment, but you can't get that to
work on accelarated ST's.

The STe has real hardware scrolling. You can set the screenbase on
a word boundary and delay the screen output for n pixels, getting
scrolling on pixel level both in x and y directions.

Mmmm, must have missed something, where are you doing this?
Especially those 20 extra sprites sound quite impressive, are
they all visible at the same time? Do they also move behind
backgroud objects?

Well, you know what my specs are:
8 way scrolling, 160x320 playfield, chip music and sound FX on ST,
STe, TT and Falcon. DMA music on STe, TT and Falcon. 32x21 sprite,
screen overlay. Running in 512kB. All in two vbl's, on Falcon and
TT one vbl mode.

Do I qualify?

Bye, Hans

 We call it "Cheap Hardware scrolling" on the FM, I can show you full
screen cheap hardware scrolling on a fm easy in one vbl, but only
vertical :) and its not real ...IYSWIM

 8x27 pi1 screens... well it was a few years ago... but I was well off
wasn't I :)

>
>Peter Rottengatter wrote:
>> Let's see. 30 times ST-Low, that's 5 times ST-Low in x and 6 times ST-Low in

 Sorry Peter as above, I was a mile off....27 screens by 8 screens, on
a One meg FM from floppy..... hehehe

>BTW Tony: if you call Heartland fast scrolling, how would you
>call a game that scrolls twice as fast? (I mean here a screen
>update every vbl in stead of every second vbl.)

You have to remember I never said "THE fastest" just fast, and I know you agree it is :), Compared to a lot of games I have seen then it is, and as everyone expects STOS to equal jerky and flip screen, then "fast" seemed to be appropriate ?

>I am afraid I don't understand this part, please elaborate.

A lot of games have baddies that will move on set paths, maybe 100 pixels to left then 100 to right, just set paths, this is simple to do and not to heavy on the processor time....

However in H.E.R.O. the baddies look where they are going, if they reach a door then they stop... however if Jim our main sprite has opened that door, then the next time the baddie reaches it, it will go through the door until it reaches the next thing to stop it,

Drops of green goo drip from broken pipes and cielings, lets say some is dripping onto a lift, if you send the lift down a couple of screens, then the drips will drip down to wherever the lift is,

OK not exactly state of the art IE but it does take a lot more proc

time and its not something you see too often is it!, its an
enhancenebt to the game... and thus mentioned,

>> 8) Background Music AND Sampled sound for FX, split into following
>>   FM=Background sound only
>
>Why not playing a chip tune?

 eeerm thats what it is... FM has a chipmusic playing in the
background...no sampled sound, or it has no music but uses chip sfx,
of which I only know one ands thats from the Killing game show, wish
there where more..

>>   Falcon to have enhanced sound quality
>
>Where are the effects? Even in Heartland I did them on the Falcon.

 better sound quality I said.. there should be the same sample, but
sampled at a better rate, if extra memory or falcon is detected then
it loads and uses the better sample, pretty sure this was implemented
for diamond Ice, cant remeber for heartland.. :)
 I could have used bigger and better sampled, BUT what everyone seems
to forget when talking about enhancements, is that we still have to
support the lower machine, and floppy disk users, what floppy disk
user wants extra couple of meg sample files that he cant even hear ?

>What do you do on a TT?

 Seems to play them all according to game testers ? chip music and
samples... and as a TT always has more memory then it gets the
enhanced sound,

>> of the obove, with at least one game supporting ALL of the above thus
>> proving it can be done,
>
>And it's speed, screen updates every VNL, second VBL, 3rd VBL...?

 hmmm I don't see the need for this question.. beauty is in the eye of
the beholder surely?.... <smile> a game player does not care how many
vbl's, he does not care if the code is speghetti (like mine is) and he
doesnt care what language was used (this is supposing he is a little
more mature than to refuse to try it just because its STOS)

>Mmmm, must have missed something, where are you doing this?
>Especially those 20 extra sprites sound quite impressive, are

 HERO has 20 baddies in every level, all are being drawn, not all are
on screen at the same time, that would be SILLY!,

 BTW to maybe impress you even more, the 20 sprites consist of 5
different types of baddies, all that move and act differently so must
have seperate routines, eg: flying or floor walking or droping from
cieling etc..

The above 20 sprites not include the animated burning water or the animated lazer beams :))

>they all visible at the same time? Do they also move behind
>backgroud objects?

None..not even the main charactor moves behind objects in this example, hmmm did I say at least one game features everything ?... I amy have said that.. whoops sorry my mistake :)
>
>Well, you know what my specs are:
>8 way scrolling, 160x320 playfield, chip music and sound FX on ST,

But your version was no more compatable than my version, also your version did not have everything in it when I saw it..???

You proved beyond doubt that it could be achieved in C, but as for compatability, yours would not run on more machines than my version.. and theres no prrof it would even run on as many ?

>STe, TT and Falcon. DMA music on STe, TT and Falcon. 32x21 sprite,
>screen overlay. Running in 512kB. All in two vbl's, on Falcon and
>TT one vbl mode.
>
>Do I qualify?

You already qualify, because you are the ONLY person in this newsgroup who has the balls to back up what he says :)

"Algorithms" by Sedgewick is one of the best references on
programming ever written. Another is "The Art of Computer
Programming" by Knuth.

f > Instead of giving me "poiters" of where to look, Why not be
f > helpfull and tell me what that book says.....

He devotes an entire chapter to the subject. However, the most
commonly used method is as follows:

```
  a[0] = seed;
  for(i=1; i<N, i++) a[i] = mod( a[i-1]*b + 1, m);
```

for some constants b and m. The trick is finding a good value for b
(for a particular m). This is usually done by trial and error.

Setting standards like this you need to say something
about the speed. It is possible to do it all, including
20 free moving sprites in a GEM window, screen updates
will cost some time, but you didn't say anything about
speed, so anyone doing this in a GEM window will
satisfy to your challenge.

> vbl's, he does not care if the code is speghetti (like mine is) and he
> doesnt care what language was used (this is supposing he is a little
> more mature than to refuse to try it just because its STOS)

Nor does he care for the number of sprites and so on. You set
here a technical challenge so you have to specify something
about speed.

BTW: going from two VBL to one VBL code makes a great
difference in gameplay.

> >Mmmm, must have missed something, where are you doing this?

Why would dat be silly? Ever played Llamatron? That has a real
huge baddy count and is definitly not silly.

> BTW to maybe impress you even more, the 20 sprites consist of 5

Doesn't impress me at all.

You surely have said that. Time to rewrite the original specs:
---------->8----------
Tony Greenwood wrote:
This is what I do.....

<start>----------

A standard Arcade style game

1) 8 way scrolling.
2) Optimum screen size of 200x200 remainder taken by info
3) 32x32 main charactor sprite
4) 20 individual free roaming sprites (Free roaming does NOT mean set paths, the sprites act on object placed or removed by main sprite) also this is per level,

Number of sprites visible at the same time:
( ) 1
( ) 2
( ) 3

5) 16 Colours
6) Screen overlay, so sprites move behind scenery
Not always
7) Full one meg of memory (to include standard floppy disk setups)
8) Background Music AND Sampled sound for FX, split into following
FM=Background sound only
STe=Background sound and sampled FX
Falcon and above Sampled FX only
Falcon to have enhanced sound quality
9) Animated backdrops, Unlimited animation on game backgrounds
10) Joystick support
11) Support for Minimum 1 meg FM to Falcons with Nemesis or other fingies?, Also TT's and megas

12) gamespeed: screen updated every second VBL?
----------8<----------

My version runs on 512kB STs too, yours didn't.

Dear Atari owners,

I am wondering if anyone can help me.

I own an Atari Mega 1 that I use for music. It originally came with Microsoft Word for ST and I currently need to do some word processing on it.

Unfortunately, though I still have the mauals and documentation, the Word disk was stolen and I need to get a replacement. Does anyone have a copy of Word for ST they can send me or email me?

Please email me directly since I do not receive all postings to the group.

Thank you for your assistance,

Robert Davis

p.s. Please don't flame me about software piracy. I have purchased all
the software I use, I do own a licence for this package and this package
is not currently sold commercially.

Robert Davis

Hi everyone,
I've got a question which has been bugging me for some time now. I've heard that the atomic decompression routines, (as used in quite a lot of demos/games) aren't compatible with the falcon. Is this true? If so can anyone explain why? They don't seem to do a lot hardware specific calls, they mainly just do a lot of complicated bit operations, and rely on the flag resgister an awful lot, does the falcon flag register behave slightly differently or something, or am I just missing something really obvious? :-)

Andrew

P.S I think I was a bit rude in my previous messages, (sorry Peter!) I don't know what came over me! Rest assured that I am now sane once again! :-)

I was wondering if anyone knows of C bindings that will allow putting a menu in the GEM window infoline?

I know GFA has some library functions that do it, but I haven't

been able to locate C bindings to achieve a similar result...

Otherwise, how could one install a menu within a dialogue, with
proper handling of the menu's pulldown?

Please Cc reply through e-mail. Thanks.

For the self extracting routines, yes. I believe the "extract an atomic
archive" routines work ok, but not as useful...

If so can
> anyone explain why? They don't seem to do a lot hardware specific calls,

They use self modifying code, IIRC, which screws up if you have separate
data and instruction caches, like in the 030, because the data cache holds
the modified code, and the instruction cache holds the original code.

Hi Qfunk

> I was wondering if anyone knows of C bindings that will allow
> putting a menu in the GEM window infoline?

The last release of FLDLIB (0.94b?) had menus attached to the windowed dialogues. Personally I dont like these, so I haven't really looked at how it works in detail, although I do remember that FLDLib used AES 3.4 popups in its implementation (for simplicity, I guess... you could write generic versions if you wanted to).

> on an ST - so if the game is running at 1vbl then you could potentially be
> playing a game that is running 40% faster than it should be.

I wasn't talking about the VBLs of course, they are bad for this. But the 200 Hz interrupt runs far more precise than is required.

If just a defined delay is required, one could also simply access the 200 Hz counter, for which one does not need to install interrupt handlers.

> Also, in general, the higher the resolution, the slower the machine gets. So,
> how do you know if the machine is fast enough to cope with the game at the
> "intended" speed?

That's not the programmer's worry. Maybe you should mention it in your readme files that goes with the game, that it may be too slow with the chosen resolution, and the player should switch resolution in order to enhance speed.

I can ask the other way round : How do you know the machine is too slow to cope with the game at the given resolution ? There is no point in refusing to run a game in 1024x800 on a Hades entirely due to speed assumptions, because the Hades is fast enough to handle it.

I should add : There is no point in refusing to run a game in 1024x800 on any Atari, because you cannot know if the player has miraculously sped up the machine a lot.

Then I should add, there are machines out there where CPU speed is not affected by screen resolution, because all the graphics work is handled by a graphics coprocessor.

So making such assumptions is bad programming style. I'm not saying that your style is bad, but your statement above might mislead some other programmers to using such style, which should be avoided.

> It was their failure to provide a generic call in the ST that has caused this
> problem.

I guess we can agree on this. ;-) But if they had, the problem would still be there, only slightly relieved. This is because different hardware supports usually not just additional resolution settings, but supports *different* settings. So on some hardware 800x600 will exist, but no 1024x800, then other hardware might support the latter but not the former. This is why it's important that software is able to adapt.

>> AFAIK is HAS
>> BEENhas beenchanged already with recent NVDI.
>
> Please tell me what call to use then. As I mentioned in another post,

I've been told it's in NVDI V4. I don't have V4, just V3.02, and that's why

I said AFAIK. I gotta ask others for this.

> If I want to play an arcade game, I dont want it running in a small window
> in the top-left corner of the screen (or whatever), I want it full-screen
> no distractions.

That should be the user's choice, don't you think so ? Or are you thinking
everybody else will think the same way as you do ?

I will usually play such a game when I have some idle time, waiting for an
FTP download to finish or similar. In such a case I want the FTP window on
the screen next to my game so that I know when it's done. Mario Becroft's
Pacman is very nice in this respect, it is an arcade game running exactly
the way some people here are saying is impossible.

> Find my someone who likes playing Quake no the PC in a window
> - you certainly wont find many who dont play full-screen.

Because they can't. I'm sure I'd find some who would if it were possible.

> Equally, its hassle for me as a user to be TOLD to change resolution by
> a program, when I know full well that it is capable of doing it for itself.

If you "know" that, then - sorry - you're entirely wrong on this. No program
can be sure if it will be capable of switching resolutions properly by it's
own. Sure it can attempt to, but it's likely the program will not have any
chance to tell if it succeeded, only the user can tell when he sees a garbled
screen output.

> This seems a very strange way of doing it... IMO not what the games-playing
> public want.

Because they aren't aware of the situation. But you, as a programmer, are,
and you should be able to teach them on this, by writing an appropriate
paragraph in the README. The user is not in the situation of dictating what
is possible - if he were then I'd ask my hardware to support 3000x2000
True-Color modes ;-) Some improvements can be done by using hacks (this is
what I call fiddling with hardware to set video modes), but it leads to
the situation that few users can use the program. I know, people don't care
if their favourite program works on their neighbors machine, but I do not
think this is something that should be encouraged. People should be made
understand that the little hassle (if it's needed in the first place) is
essential in order to let others have fun too with that program.

>> > On my 1008x608x4bit screen there's room for a lot of ST-low games at once.
>>
>> This would work indeed if the games would run in windows, and used VDI.
>> But any setting of video mode by the game on it's own screws up the lot.

>
> But then, would anyone actually try and PLAY that many games at once? The

Depends on the type of games. I'm not a fanatic of arcade games, and as such, the type of game I usually prefer is that of which several ones can be played at the same time.

> answer is of course no, you would only want to play one game at a time,

There is an often made mistake. People tend to think their own opinion would hold for the whole world. This is an assumption that has led to so much hardship in the history of our planet, that I had guessed everyone nowadays should be ready to accept that other people in other circumstances will grow entirely different opinions and habits.

So please accept that for this reason the line of yours that I quoted above is rubbish, especially the "of course".

> so why have it only taking up 1/9th of your screen, with the rest displaying
> the desktop?

There are more reasons for one or the other than you can remotely guess. Therefore it's pretty arrogant to dismiss half of them, by denying existence of reasons to restrict a game to only 1/9th of the screen.

>> > requires ST compatible resolutions, but that isn't the programs support - if
>> > the machine cannot do what an ST can do, users should EXPECT games designed
>> > for the ST not to work.

There are programming techniques that make such expectations obsolete. It CAN be done, games that run on all machines. So there is no reason to expect such a thing. The current situation merely makes me *suspect* that a given game won't run, and as it can be done, I'd be happy if this could be changed. Currently it's sadly prevented by certain people simply refusing to try other techniques, techniques that in some cases even save work.

>> Why design such games in the first place ? The Atari world is a lot bigger
>> nowadays (in terms of different models), and it's far from impossible to
>> design games such that they run on most if not all models.
>
> Yea, but the "most if not all" models are the low end STs,

Sorry but this is rubbish, especially the "if not all" in your sentence. If it holded then there were no other models, and the discussion had never started in the first place.

You might be judging from the situation in the UK, maybe the "most" is true there, but here in Germany the situation is entirely different, and in other countries the situation is different again. I thought only bloody germans

are so self centered when it comes to Atari software, but I begin to realise
that UK people can do just as "well". ;-)

>> > If, say, Super()/Supexec() was removed from user programs (as has been

> not to provide ST-low compatibility, then you could take it up with them.

Agreed. But it doesn't help. A system that does not provide any ST video
mode may still make Setscreen behave is if ST-Low is used (or were present).
This was a descision by Atari to not break older software that cannot deal
with getting other video modes as return values from those XBios calls.

> Oh, I'm not the one advocating that you change the way you program... thats
> you, telling Tony to switch to using the VDI, which will not benefit him one
> iota, appart from making you happy...

Oh, I'm not telling him to do so. I'm merely trying to convince him to just
try once to program using GEM methods. The experience might let him use
it for programs that do not require super-fast scrolling on small machines.
If he only does that then I'm happy ;-)

> If Hades/Medusa/Milan owners want games that make use of their systems,
> then they should consider writing them themselves, rather than expecting
> people with a bottom of the range ST to write them...

All what I'm saying is that there are many types of games that can be
developed on a basic off-the-shelf 8 MHz ST to run even on the fasted
machines in a sensible and enjoyable way. It merely needs a little
discipline and use of standardized methods to achieve this.

Cheers Peter

> Well I don't think NVDI is the answer for 2 reasons. a) It take up a sizeable
> proportion of memory on the ST,

Only if you install vector fonts. This might be a problem though with 512 k
machines, are there many of them left ?

> and secondly, (unless I'm mistaken.) doesn't it
> cost quite a lot of money?

No. It costs money, so much is true, but I think it's rather cheap compared
to what it does.

> It would hardly be ideal that anyone wanting to play
> that particular game has to fork out huge amounts of money first to get the
> upgrade.

NVDI is installed on about 70% to 85% of all german Ataris that are still
in use. So even though I don't know the numbers elsewhere, I think this is
not too much an issue, especially as I do not consider the price a "huge
amount of money".

>> Would like to know what I've got to do with Falcons. You're admitting clearly

Does that mean I do a lot on Falcons ? I don't own even one of them. Thorough
knowledge of all systems that potentially run one's software is a rather
desirable prerequisite for writing good portable software.

>> If you mentioned the word "game" in this sentence, it would make a little

An insulted person won't laugh, would he ? This was to much ridicolous to
be any insulting for me.

> that people were becoming rather insulting towards tony, and his programs, and
he
> IS a really good programmer too. :-)

I do not say that he is not a good programmer. I only say that he is a fair
bit stubborn when it comes to using GEM methods.

Since you quoted exactly that part, I responded to exactly that. There were
multiple question in the original posting, and these needed to be answered
separate.

>This while talking about code that checks for RAM.

I read that, and I think I stated that this will work.

>If he wanted to do a RERUN, then "the 68000 doesn't put enough info into its
>BUSERR stack frame to allow it to continue/restart the failing instruction"
>is still rubbish since in this context it implies that the 68000 could do it
>if just enough info were there. It requires a little more in the CPU core.

No - it is sufficient to put enough information in the stack frame so that
the expection handler can do what is necessary without restarting the
instruction. If only the address of the faulting instruction were p?resent
in the stack frame, the exception handler could do what is necessary
(although this would require some effort).

The Toolbox is a 32k TSR which runs from the AUTO folder during bootup.

Once it initialises itself, it will then go looking for libraries to load
(in the "\TLBX" folder of the boot drive)

It will search this location and then checks each file it finds there to
see if it fits the profile of a library. If so, it will be loaded (if it
has the "boot me" flag set)

The Toolbox will then go TSR, with all libraries loaded so far being kept.

Later on, an application can use the Toolbox to call existing libraries,
to load or release libraries it may have loaded, to query library files
on disc and so forth.

To do so, one must first locate the Toolbox. This is done by calling
XBIOS function xtlbxID() (number 0x7462, 'tb').

The interface for this function is as follows:

```
uint32 xtlbxID( uint32 zero );

xtlbxID:
     clr.l     -(sp)
     move.w    #'tb',-(sp)
     trap #14
     addq.w    #2+4,sp
```

This will return 0x545C5268 ("TLBX") in data register D0. Any other value
means that The Toolbox does not exist.

Hi, everybody,

I have written for my own usage a utility program. Its operation needs to be able to obtain the current alphanumeric (VT52) cursor position (row, column). To do this, I make at the initialisation phase the LineA call 0 to get the address of the LineA data structure. This structure contains the information that I need.

The program runs fine.
However, I would like to get rid of LineA. Well, but I am unable to figure out how to do what I want without it.

--> Who knows a "legal" method for obtaining the current X-Y position of the text cursor?

Incidentally, what is exactly the situation with LineA for '030 and up Atari computers. I have heard inconsistent things on the subject.

Thanks in advance.

Roland

Tisk, tisk...

: excist. Actually I think most Falcon owners thinks like me. Atleast 256
: colours or it's not worth it. Maybe we are narrow minded, but who cares?

I haven't seen many _good_ Falcon-only games yet (except the ones by the
Reservoir Gods, good stuff!). I have tons of really good ST-games.

Anyway, I *hate* that awful Falcon 256 colour mode, with its 8-interleaved
bitplanes. I once wrote some assembly code to handle this bitplane format.
Not surprisingly, it ended up being *at lot* bigger (and slower!) than
the code for a 'normal' 256 colour mode.

It is? I didn't read through it as I know he was talking about PacMan
erlier. :-)

Forgive me for my ignorance, but for someone who has never played
TRON, what kind of game is it? :-)

> Nice one Hans... keep going. :)

Yup. Great!!!!

Well to be serious for a moment...Isn't the above what you and
everyone else is telling me I don't need to do to make a Falcon
enhanced game, Three people, yourslef, Mario and Peter all say I
should be able to do it without testing,

No fooling....Do you see my dillema ?

 Yes....and you run them on a TT or Falcon and thats it, you don't
need to do anything special to them ie: no fixing.. ho come now, you
do know what we are reffering to, how old STOS games used to have to
be fixed.. well mine don't :)

>> work on Nova ? and say I should program it properly?, and you say this
>> is the way it should be done?... hahahahaha won't even work on a STe

 I have to apologise, I did not know you had written it, I thought it
was a game you where offering as an example of how game making should
be done... I missunderstood :)

>Just because you are such a lovely person I will fix the bug (because it
>is

Why not? I don't find obsession that cool.

> > realy fun to play. Even some fancy graphics should be possible in 256
> >colour
> > modes on a gfx card. The same goes for the above.
>
> >Anyone wanting to try?
>

> Yeagh lests see someone put obsession in a GEM window on a STe..
> hahahaha dream on people...

Why not? If you run it in mono you will atleast get a screen area as big as Obsession and you will get rid of that annoying scrolling screen which
is a pain in the arse if you ask me.

If you then have a Falcon you can run in atleast 800x600 256 colours and you wont need any scrolling screen. Moving around a ball in a GEM window on a regular Falcon or on a ST for the matter can't be that hard. I guess
getting the ball to move decent isn't to easy, but it should surely be possible even on a ST.

I can agree that making GEM games running on a ST in ST low is rather pointless but there are others not using ST-low. They either have a ST with mono monitor or a Falcon or TT or something else. What about those? Should they not be able to play games?

Rubbish. I guess it's an illusion what I have got here then. It does
exist, it has just not been released yet to the public because of lack
of levels.

:-)

It's not very good, as I'm not very good at programming this sort of
stuff, but you can find it at my webpage. See the url below. Also,
it is apprently not STe compatible right now.... okey, so shot me!

:-)

Ofcourse. The thing was that I though STOS was supposed to handle
this stuff as it's such a great language. But I can see that it's
a problem, ofcourse.

Peter Rottengatter wrote:
> BTW.: There is a fix for the harddisk folders problems in TOS 1.0x !

Yes, I know, but that's not the only reason I like
KAOS. I am totally addicted to the genial drop back
buttons. Don't like any windowing system that lacks
theze buttons.

Also harddisk performance is great with KAOS. My
20MHz ST compiles the complete ARJ project some
times faster then a Falcon (using the same SCSI
harddisk system).

STOS doesn't guarantee it will work on those machines,
a (stupid) programmer kan make a game incompatible
by using machine specific functions. STOS won't
prefent you doing stupid things, nor any other
language.

You don't need a Falcon to get 256 colors, a TT can do
it too, and gemulator, and magic PC and all Atari
clones. So when STOS is running in 256 color mode of the
Gemulator you can design and test 256 color games on the
Gemulator in 256 color mode. Right?

If STOS can't do 256 color games in 256 color mode
of the Gemulator that's clearly STOS fault, but that
won't be the case, STOS being such a great language
as you tell everybody.

Bye, Hans

Hi!

In article <34ef0a68.15542248@news.demon.co.uk>,
    guy@swampdog.demon.co.uk (Guy Harrison) writes:
> -1[cp] ???   ;-)

Yes, that yields the same result as cp[-1]. a[b] is in fact *(a + (b)), so
it's irrelevant what you put first, the pointer or the index.

This variant is often used in submissions for the IOCCC, as some people
don't know about it and therefore get confused (which is the goal of
these submissions :)

Ciao

Thomas

> How would you switch from 1024 x 768 x 24 bit true color at 80 Hz to
> 320 x 200 x 16 at 50 Hz and back (!!!) via Setscreen?

You dont - see my other post about Atari's lack of support for this. However,
STOS is aware of Falcon resolutions, and correctly handles these. Otherwise,
it has to fall back on the only other Atari defined standard - ie. that
setscreen will return the current mode, and setting mode 0 will change to
ST-Low. STOS "assumes" that when it uses setscreen again with the "current
mode" on startup that it will restore the mode to previous settings. This
isn't true, but it COULD be handled by relevent software/hardware updates.

> Do you think that Setscreen will work with ISA/PCI graphic cards?

No, but what alternative is there? None. If a standard existed, there would be not problem, but there IS NOT a standard way of handling it.

> Have you read the atari documentations:

Not Atari's, but I've read the comendium and MASS.

> "It is maintained fo backward compatibility with existing ST programs only.

Yea, so it should WORK AS DEFINED FOR THE ST. If some PCI gfx card doesn't support this, people should NOT whine about compatiblity with programs designed for the ST.

> It should not be used for new programs. It will not keep pace with future
> hardware or software improvements. The VDI should be used."

Yea, and prey tell, how does the VDI change in to ST-low then?

> There is no working Setscreen call on the newer machines. All you can
> interrogate are VDI functions. (current resolution & color depth)

Wrong - Falcon has Vsetscreen, and Vsetmode.

> So STOS applications are running under MagiC (Single Mode) and MagiC PC/Mac?

Too hardware dependent for MagicMac. Dunno about MagicPC, however there is an issue with Magic yet too be resolved, I believe (I neither have, nor want Magic, so I am unable to directly debug this problem).

> How many of these "new" STOS applications do exist?

Well, all Tony's games are "new", and there are several others producing them. Tony's diskmag shells are used by a lot of diskmags.

Er, sorry? I can get ST-Low, Medium, and Hi on both RGB and VGA on my Falcon.
So there is 76.4% (15280) of your 20000 people. I dont know what a
"DTP Monitor"
is, but I guess you mean that they dont have ST Low. As for SM124, that only
supports ST-Hi, and has already been pointed out a number of times, STOS *does*
support this resolution.

Yea, but this is an EXCELENT example of why its stupid to try and write a game that is specifically designed for another machine. Magnus has proved its hard enough to even make a game compatible with other machines, let alone writing a game that wont even run on your development machine.

This bug may be an easy one to fix, but you can bet that a major project like a multi-directional scroller, in a >=256 mode (using >16 colours) when working on an STe would have something a lot bigger than this go wrong.

> Arrghh..... I guess I have to test it on a STe before I release any new
> version, or atleast check which machine it's running on as I don't do
> that now. :-)

Oh dear... and this raises another question... you guys are worried about "clone" compatibilty... well, AIUI, none of these have Atari compatible sound-systems (certainly not the Hades/Medusa, as these use either PC soundblasters, or the StarTrack, neither of which uses the Atari defined frequencies) so how the hell is a game (with sound - you wont find any without it) supposed to run correctly on these machines?

Ok, so you could check the cookie jar, assuming they set it correctly (if they dont, the designers should be shot), but the game is not going to run "correctly" due to the abscence of features, so some would argue that it should simply exit gracefully and report that the machine isn't good enough...

BTW. could anyone tell me what the clones put in the cookie-jar? (eg. _MCH's value would be interesting, as would _SND/_VDO).

Well, STOS does just the same as Lattice... A STOS program can be
made incompatible with everything quite easily by the programmer
in just the same way as in any language that allows direct access
to the hardware and/or the OS.

It is consistent though Tony. It behaved exactly the same under MagiC
as well! At least it came up with an error message and terminated
leaving a clean system - no need to reboot! ;-)

A little more seriously. I was quite sad it didn't work as personally
I'm not too bothered about sound (here). What I wanted to see was the
animation and try it out under different environments in order to gain
an idea what sort of problems are involved with "compatibility".

I am the worst person to ask about sound. I've never done anything
with it (apart from electrocute myself, but that's another story).

For the purposes of this thread it wouldn't bother me in the slightest
if you just disabled the sound completely for now. It's the animation
under different environments I'm interested in atm - not gameplay.

> rerun bit or what it was called).

Taking strictly what Gaven wrote in his recent message (mentioning restarting an instruction), you're right. Maybe Centek jumped on that too. But that was not the issue here. I may cite from the message that started the thread (by Gaven too) :

> However, will there be any problems if I just ignore the buserr, and just
> JMP to the next instruction after the test loop? I am using a 68030
> system, and no harm seems to befall it when I do, but will a 68000 be able
> to survive?

This while talking about code that checks for RAM.

This tells clearly that Gaven is not after restarting the instruction. He wants to abandon the instruction that gave him the bus error, and execute the next one. This is clearly possible with every 680x0, even 68000, and does not require the RERUN feature of later CPUs. Why should he want to rerun the instruction when checking for RAM ? If he got a bus error then probably there is no RAM there, which makes rerunning the instruction pointless as it would just give another bus error.

Probably it's just not clear for many people that restarting an instruction is *not* the same as "ignore the buserr, and just JMP to the next instruction" which Gaven mentioned is what he wanted.

If he wanted to do a RERUN, then "the 68000 doesn't put enough info into its BUSERR stack frame to allow it to continue/restart the failing instruction" is still rubbish since in this context it implies that the 68000 could do it if just enough info were there. It requires a little more in the CPU core.

Cheers Peter

 I think your flogging a dead horse Anthony, they all seem to think
that if you have access to 256 colours, even if its under Gemulator?
then you can make enhanced games that work on all machines... and hey
you don't even have to test them,
 I can quote Peter, Magnus, Mario and Hans all advocating the above,

 Yet tell them its not that simple and they say I am talking crap...

 Well they can TALK all they want.. while I make yet another game for
the ATARI ST,FM,STe Mega and MegaSTe, Falcons enhanced or not and even
TT's...while I make a game that works fine on all these machines, all
the "Know it alls" in this group can sit here telling everyone how

crap I am and how I can't program them correctly.... But while I prove
"yet again" what I can do.. they can just sit here and TALK...

Actually they do exist. It's just that I still need to make some
improvements before distributing them. A number of beta testers have
working versions of the games already.

Well as I said it's not a great program and when I tried it yesterday
it realy looked horrible compared to some other games out there. :-)

But I will try to get the time to fix it tonight and upload it
tomorrow.

I guess I better say that it probably will be slow on a ST. I'm no
super duper programmer who can find 10 bugs in TOS and it's all
written in C and doesn't use any fancy tricks at all.

BTW. I tried Centipade yesterday in 800x600 256 colours and it was
realy realy realy fast. Actaully to fast so I had to slow it down.
And this game has got many sprites moving on the screen at the same
time at a crazy speed on my AB040/Nova.

Well, I'm only suing some routines I got from Anthony. Nothing fancy at
all. :-)

BTW. Will these routines work on a STe as well?

> For the purposes of this thread it wouldn't bother me in the slightest
> if you just disabled the sound completely for now. It's the animation
> under different environments I'm interested in atm - not gameplay.

I will do that. I think there might be another thing in there as well
which may cause problems. I turn off the keyclicks and as there are
no OS calls for making this I have to write directly to a register. Will
this work on a ST as well or have they changed it? Maybe I have to
remove
that as well....

> >I don't remember what I do at startup anyway. :-)

There's a good breakout at:
ftp.uni-regensburg.de/pub/freeware/software/atari/falcon/games/
walz_201.zip

Runs in a gem window, but Falcon only, I think - the colors are
corrupted on my TT/Cr.dots.

Don't think that's realy the case. The only thing you need to
change in my Heartland is the graphic output. The whole game
engine stays the same. The main thing is to realize that there
are 8 bitplanes in stead of four. The whole graphics engine
has to do twice the work it does in 4 bitplane mode. All
testing can be done in 4 bitplane mode. Switching to 8
bitplanes can be done with a simple define.

Doing true color stuff on an ST is a lot harder. (I know,
I did it once.)

> frequencies) so how the hell is a game (with sound - you wont find any
> without it) supposed to run correctly on these machines?

The Hades has the ST sounchip on board and plays without problems
de Crapman musics, it doesn't display anything usefull though.
I started Crapman on a Hades 060, the game music comes up, you can
play a game and quit it, returning to the Hades desktop but there
isn't much to see from the game.

> Ok, so you could check the cookie jar, assuming they set it correctly
> (if they dont, the designers should be shot), but the game is not going
> to run "correctly" due to the abscence of features, so some would argue
> that it should simply exit gracefully and report that the machine isn't
> good enough...

If there is no sound chip present you don't play chip music. Same
is true for digimusic between ST and STe's.

> BTW. could anyone tell me what the clones put in the cookie-jar? (eg. _MCH's
> value would be interesting, as would _SND/_VDO).

AFAIK for the Hades 060:
_CPU = 60
_FPU = Bit 3 is set
_MCH = TT
_SND = Bit 0 is set
_VDO = don't know, maybe someone can fill me in here.

Hans

Ho ho ho.... yet another example of timing problems on "platform
independent" software. :-)

Hehehe... definately not. :)

> BTW. Will these routines work on a STe as well?

Well, if its the code I think you are talking about (soundcmd(), devconnect()
etc) then no, its Falcon only stuff.

The *only* sound XBIOS call that is defined that is available on STe and
above is Waveplay() (the SAM installed routine, so not in any version by
default, but can be retro fitted). Otherwise, you have to directly access
the DMA registers yourself.

> which may cause problems. I turn off the keyclicks and as there are
> no OS calls for making this I have to write directly to a register. Will
> this work on a ST as well or have they changed it? Maybe I have to
> remove that as well....

You have to be careful with that one... it is the same on the ST, and
other machines, but IIRC, there is other stuff in that register (like
the Falcon's IDE on/off switch, and summat for the TT), so be sure that
you only change the correct bit.

Who knows what it'd do on a Hades/whatever...

Have you written any ST/STE software in the last six months. If so
then email me with the details and where I can get it. I review the
latest ST Software in the ST+ Fanzine every month and I'm always on
the lookout for new software.

GFA Basic 3 has a very large similarity to C in so far as most of the AES functions are directly available, unlike v2. The 'reasonable' approximation was what you put above, although the correct code should be something like this, hopefully.

```
dim bubble.message.buffer&(8)
' set aside an array for the message to BubbleGEM
'
ap_id&=APPL_INIT()
' Get GFAs/our ap_id. This is a dummy function as it returns the
```

```
' interpretors ap_id, if not compiled. When compiled, I think the startup
' code does an appl_init() and this is returned when the function is called.
'
bubble_id&=APPL_FIND("BUBBLE  ")
' get BubbleGEMs ap_id
'
IF bubble_id&<>-1
  ' if it's NOT -1, BubbleGEM is installed
  '
  message$="It works in GFA basic too"+mki$(0)
  ' The MKI$(0) was added to ensure message$ has a '\0' for C compatability
  ' This is the message that should be displayed.
  '
  bubble.message.buffer&(0)=&Hbabb
  ' BUBBLEGEM show flag
  '
  bubble.message.buffer&(1)=ap_id&
  ' calling ap_id, ie. ours
  '
  bubble.message.buffer&(2)=0
  ' since we're only sending 16 bytes, this is set to 0
  '
  ~EVNT_MULTI(32,0,0,0,0,0,0,0,0,0,0,0,0,0,bubble.message.buffer&(0),0)
  ' call evnt_multi with a timer event (instant return) to get present
  ' mouse position/button state.
  '
  bubble.message.buffer&(3)=MENU(10)
  ' horizontal mouse position
  '
  bubble.message.buffer&(4)=MENU(11)
  ' vertical mouse position
  '
  LPOKE V:bubble.message.buffer&(5),V:message$
  ' this is a quicker way of doing the following since needs no calculations
  '
  ' bubble.message.buffer&(5)=AND(ror(V:message$,16),&Hffff)
  ' bubble.message.buffer&(6)=and(V:message$,&Hffff)
  '
  bubble.message.buffer&(7)=0
  ' set to 0, just for safety
  '
  IF MENU(12)=2
    ' right mouse button down
    '
    ~APPL_WRITE(bubble_id&,16,V:bubble.message.buffer&(0))
    ' send the message to BubbleGEM
    '
    DO
      ~EVNT_MESAG(0)
      ' wait for an event.
      '
      SELECT MENU(1)
      CASE &Hbabc
```

```
        ' If BubbleGEM ack received, do anything else wanted
        '
      EXIT IF TRUE
        ' then exit the loop
        '
      DEFAULT
        ' don't do anything.
        '
      ENDSELECT
    LOOP
  ENDIF
ELSE
  ' stuff here is executed if BubbleGEM isn't present.
ENDIF
```

If you can find a way to review the Zero-X
audio program (distributed by Wizztronics
in the US), I'd go out of my way to obtain
that issue of ST+ Fanzine! It's important
to know more about the software before spending

US$230.00 on it!

> you don't even have to test them,
> I can quote Peter, Magnus, Mario and Hans all advocating the above,

No. You're mixing things up here. We said we advocate portable programming. If you do that, and strictly follow the rules, testing just on few machines is required to get the game off the ground on all machines. This still does not mean it would run perfect in every respect on all machines. But it will get it running, so that the user of another machine can tell precisely what he wants improved in which way.

Writing a game "that is specifically designed for" a machine is precisely that what we all advocated against. But again this does not mean that one shouldn't check what kind of machine the program is gonna run on, it's sometimes essential to know which methods to employ. Of course this requires some thorough knowledge how certain things are (supposed to be) done in the Atari world.

I mentioned that Centipede game. AFAIK it's been tested on only two machines, yet it runs on every Atari I know of !

Cheers Peter

> STOS is aware of Falcon resolutions, and correctly handles these. Otherwise,

It's been quite a while (many years in fact) ago that Atari officially
announced that XBios is not to be used anymore for Video related things.
Since then at least, switching video modes via Setscreen, or inquiring
video modes and screen addresses by XBios means is a no-no, i.e. to be
avoided in portable programming. Uwe basically cited that in his earlier
posting.

It can all be done in a 100 % portable way by using VDI, so it's that
what is pretty much a must for portable programming. Pity that so many
people here have a personal dislike for it, especially as it's really
powerful.

>> Do you think that Setscreen will work with ISA/PCI graphic cards?
>
> No, but what alternative is there? None. If a standard existed, there would
> be not problem, but there IS NOT a standard way of handling it.

Of course there is a standard : VDI ! Newer NVDI even support switching
resolution IIRC.

>> Have you read the atari documentations:
>
> Not Atari's, but I've read the comendium and MASS.
>
>> "It is maintained fo backward compatibility with existing ST programs only.
>
> Yea, so it should WORK AS DEFINED FOR THE ST.

The problem is it CAN'T. There are so many technological reasons why it must fail. With graphics hardware that does not support 320x200, there is no way a Setscreen could switch it to that. With graphics hardware that keeps the screen buffer on the card and not main memory, there IS NO WAY one could access it by inquiring an address from Physbase.

BTW You refuse to read :

>> "It is maintained fo backward compatibility with existing ST programs only.

This means : You must not use it anymore ! Even if you think with the program you're writing ST resolutions are enough. It means you cannot rely on

> WORK AS DEFINED FOR THE ST.

It means if it fails for some old program than it's bad luck for the program, but then it's the program that's to be considered broken. That is what "backward compatibility" really means.

> Yea, and prey tell, how does the VDI change in to ST-low then?

If the hardware does not support ST-Low, you cannot switch to ST-Low. Period. So you'd better make your software deal with a variety of resolutions.

>> There is no working Setscreen call on the newer machines. All you can
>> interrogate are VDI functions. (current resolution & color depth)
>
> Wrong - Falcon has Vsetscreen, and Vsetmode.

No it's true. Or do you consider the Falcon a newer machine ?

If you're learned reading in school then please reread what I have agreed
with, and what Magnus has written. Read carefully. Read what's written, and
not what you'd like to interpret from it.

Magnus did not advocate Falcon enhanced games. He mentioned a different
method of programming, that by it's own gives better graphics on the Falcon,
and will give on all machines with advanced video hardware. That is not
"Falcon enhanced".

Tony you'd be far better off if you did not try to read "between the lines"
all the time. Read what's there, and try to understand what the writer meant,
not what is easiest to attack.

Cheers Peter

A 'market' implies that some exchange takes place. Do you actually SELL the
games ? What amount of money do you take for them ?

I guess it depends on how often it is played. I play it occasionly after a
tedious session of programming. But true, the diversity of ideas is rather
limited ;-)

But for that I have the other games that I described in some parallel message. And this is also the reason why I still play C64 games from time to time. In terms of ideas they are so much superior to anything that exists today. Of course technologically speaking they are inferior, but the inferior hardware was one of the reasons the programmer concentrated on a sophisticated (in terms of game ideas) implementation, rather than superfast scrolling, 3d shading etc. etc. Sure technologically speaking Tony's games are superior, but if I want to play technologically superior games, then I switch my Linux box (Pentium 133, Matrox Millenium) into DOS mode and play games with a technological quality Tony can only dream of.

> It's also only a mono game (mono graphics), so it doesn't look very
> exciting.

Ah, didn't know. But the programmer released the source code IIRC, so you can add colour into it.

Cheers Peter

Ya know, Tony loves scrolling. That's why he gets so excited by superfast scrolling games, and why he always mentions fast scrolling as the prime feature of any game. I guess games without scrolling aren't really games for him ;-)

Aaaaarrrghh ! After all these discussions this guy is still not able to expand his view of the world beyond his limited horizon :-((We accept that you do not use harddisks and a sophisticated environment. But please acknowledge that others do, and respect the needs that follow from it. What if one uses a filesystem that does a lot of buffering, and that must be sync'ed before the machine is switched off or rebooted ?

I agree entirely with Guy ! Software must have the option to exit cleanly,

not leaving a messed up machine.

Cheers Peter

Don't mix things up. The number $5a0 is not (COOKIE *), but (COOKIE **).
So you should write "cp = (COOKIE **) 0x5a0;" and only then you'd get
the first cookie by "**cp".

I guess you're referring to Pacman and Asteroids ? Mario states clearly that
he has not made them public yet, but apparently he's only waiting for you to
do a few Pacman levels ;-)

I downloaded Manoeuvre, which I was delighted to see that it's a network
game based on STiK / STinG.

Cheers Peter

Before I start I have to admit that I know next to nothing about falcon programming, However I know next to everything about ST programming, so that's what I'm going to talk about. :-)

I don't know what VDI is like on the falcon, but I can tell you that on the ST it complete and utter rubbish for writing games, it wasn't designed to be used for that sort of thing. There is absolutely NO-WAY you are going to write even a have a descent arcade game for the ST using VDI. I find it hard to believe it's much better on the falcon. OK, so the falcon is fast enough to make up for it, but you're just wasting huge amounts of power. You might be able to do a centipede or asteroids game in VDI, but that's hardly the limit of the falcons abilities. You might as well say. "Just about every computer has a spectrum emulator, so if everyone writes their games for the spectrum, everyone will be able to play them! no problems!".

So stop talking rubbish. If you REALLY want tony to write games that will run on your machines, re-write the missing-link so that all the graphics commands take IDENTICAL inputs, except work for 256 colour screens instead. Then there would be decent standard that people wanting to write cross-platform games could use. There is no-way you can expect other people who don't own falcons to write these routine for you, it just wouldn't be possible, but if you wrote them, and you wrote them well. Anyone could write a falcon enhanced game wihout needing a falcon.

Finally can you PLEASE stop moaning that you can't run ST games on your machine. If you've gone and upgraded it so much that it's no longer backwards comptible I'm not suprised! If you can't run Tony's games then I'll bet you can't run 99.99% of other ST games either. Again there is a

solution.... If you could actually be bothered to do any programming, it wouldn't be that difficult to patch the operating system so that when it receives a request for a mode your computer can no longer do, it just emulates it instead.

Oh, and don't anyone think about the usual trick of accusing me of reading between the lines, or answering a question that isn't there. I've been reading this newsgroup for ages now, (watching a really good games programmer, try to explain to 2 non-games programmers the problems with VDI or writing for a computer you don't have, for some bizzare reason under the subject heading C compiler??????). If i've misunderstood anyone's meaning then I strongly suggest you practice expressing yourselves a LOT more clearly, because that's certainly the way it comes across.

Andrew

I've written a VDI profiler that does very accurate timing. If anyone
wants to try it out, let me know.

>> nice generic routines in the VDI are going to be anywhere near as fast.
>> Particularly if you use Atari's VDI, rather than NVDI (plain standard ST,

I don't know about Atari's VDI, but NVDI and fVDI have lots of very
specialized routines. It shouldn't be possible to speed up the actual
drawing operations very much for common operations.

>Ataris VDI will be way to slow. Now when Johan in working on the next
>generation
>VDI called fVDI, why not put in some optimized routines for games? So to

Yes, why not?
(By the way, the first public version of fVDI will very likely be released
this week. Most of the information about it is already on my WWW pages.)

The problem with NVDI/fVDI for games is not that they have slow drawing
routines (they don't, in general), but that there's such a lot of overhead
to deal with. That doesn't matter when you're scrolling an entire screen,
but for 16x16 sprites it makes a _lot_ of difference. The current VDIs
also lack some features that are useful for games, such as single pass
masked blitting.

If you people could stop fighting and instead do some constructive thinking
on this subject, I'm open to ideas for implementation in fVDI.
For example:
- Reduced bitplane drawing
  Forcing the VDI to draw in only four bitplanes on eight bit hardware,
  for example. This has always been planned for fVDI (mostly to speed up
  things like editors, which usually work fine with just black and white).
- Masked blitting
  With the current VDI you have to do a masking pass on the destination
  before you can blit the real graphics, if its not a rectangle (the
  blitter has this same limitation in hardware).
  This _will_ be in fVDI no matter what (will speed up icon drawing for
  desktops that are aware of the functionality).
- Multiple blits
  This would be the way to get around the overhead I mentioned. Instead
  of using the VDI once for every single blit you would create some kind
  of table with the necessary information and then tell the VDI to do it
  all at once. I see no reason why this wouldn't be very nearly as fast
  as any specialized library.

Comments or suggestions, anyone?
Since I don't program games myself, I won't attempt to create a useful
VDI extension for it. If something can be agreed on, though, I'll

definitely help implement it in fVDI.

If we're going to have any games at all for the TOS/MiNT/Fenix/MagiC/Dolmen platform in the future, we _have_ to make it possible to write them using a standard graphics interface.

>make
>it work on any TOS box you just install fVDI and the correct driver and
>off you go.

Now, wouldn't that be nice? :-)

>Should be possible to make some speedy routines in there especially for
>games.

See above.

>Maybe an extension to fVDI and why not OpenGL support with the help of
>Doug. :-)

Actually, 3D APIs were discussed a little at the beginning of the fVDI design phase. It's not in the current plan, though.

>> If you read his post above, even Magnus doesn't believe games like Tonys
>> are possible on a plain ST.
>
>Well a 8-way scrolling game is a bit much.... but still with a fast

If hardware scrolling isn't used there's nothing that says it wouldn't be as fast in a window. It's the same memory, you can force the window to be word aligned and you could simply stop the game temporarily if its window gets overlapped by another. Naturally, you'd have to allow the game to change the palette colours when its window is on top, but there are ordinary GEM programs that do that already.

On my 1008x608x4bit screen there's room for a lot of ST-low games at once. ;-)

Please, reply to (mpointie@hol.fr)

Do you know if it is possible to find converter programs that can translate
680x0 source codes in C.
(Or better, than can translate 68000 source code in 6502)
Of course, I know that such a program will generate crappy code...
My objective is just to have something I can recompile, and that I will
optimise after.
If I cannot find, I will have to do it myself :(
This converter wouldn't have to handle self-modifying code. The syntax used
in assembler can be adapted by me, it's not really a trouble.
It should be able to locate and handle correctly CODE / DATA / BSS sections.

Thanks.

Well if you know Anthony you would also know that he hasn't got much
time
to look at this Falcon these days. He is programming on his PC now and
he
even doesn't have a monitor to his Falcon anylonger. So how can you do
something when there is noone to do it? Maybe you should start doing
some
assembler programming and patch STOS your self? Maybe you already does,
but
I don't think so. Sorry if I'm wrong.

That should trigger Anthony off! :-)))

No, there is not.

>I'm trying to write a simple text editor and just can't find a way of
>showing a cursor other than keeping track of the position
Yes, I'm afraid you must do this in any case.

> and using v_box() to draw the cursor.
You can also draw a black rectangle (v_recfl() iirc) of size equal to that of
a character, using the XOR drawing mode. This would allow to nicely display
in reverse video the character on top of which is your cursor.
You can also think about making it blinking, by using timer events in
the evnt_multi() call in the main loop of your program. The best way to achieve
this is writing alternately rectangle/character/rectangle/character/etc...

Cheers.

Okey you have convinced me. If HERO2 or Diamind Ice, or maybe both,
works on my AB040 Falcon I will download them and try them and come
back here telling you what I thought. Okey?

I can live with that I have to bypass the Nova this time... ;-)

Hey! Magnus Kollberg <magnus.kollberg**@**emw.ericsson.se> wasn't it

Fri, 20 Feb 1998 16:14:14 +0100 that you wrote:

>> >will not happen as it would probbably mean rewriting STOS. While we are

>> forward than that... please excplain why you think this may never
>> happen ?....is the world going to end... is it flat ? :)))
>
>No but there are very few enough competente programmers to do it and I
>don't think you are up to it.

 hahahaha, thats a coincidence.. niether do I :)).. but its not a
matter of not being up to it ?, I program in BASIC and to rewrite STOS
takes something of a lower level language would you not agree ..
hahaha I never for one moment suggested i could attampt to do it.. In
fact if you take the time to read the paragraph , it is quite possible
that me and you may not even be alive when it happens... I did not put
a tiem scale on it :)

>assembler programming and patch STOS your self? Maybe you already does,
>but I don't think so. Sorry if I'm wrong.

 Well you are absoloutly right, I hate the look of ASM or C, or any
other language, I like the fun of BASIC,
>
>That should trigger Anthony off! :-)))

 It did.... ho you mean the other Anthony ?.....

>> eh ?.....excuse me for being big headed... but havnt you seen the
>> software I made all those years ago ?, please do (if you have time)

>I guess I have to take a look then. :-)

 That would be nice.. then you may know a little more of what you are
reffering to.. always guessing is not a good idea :)

>> >If it is as easy to do with STOS as it should be you don't even have to
>> >test it as the only thing you did was to change the graphics from the
>> >ST version.
>>
>> ha!....dont be silly... hahahaha... you think it is that simple...
>> hahahaha sorry but it is not that simple at all...hahahahaha
>
>That is the problem but I guess you doesn't see it as you are laughing
>your head off.

 eeerm apologies.. But I don't understand the above statement at all ?

.-- Cheers !ynoT ----- Tony Greenwood (ATARI Programmer) --

>I can't see that writing a function to delete a cookie would prove to be
>much of a problem, I just don't know how to do it that's all. ;-)

Sure it is possible to write such a function, and Gaven Miller gave you
an example.

My point is that removing a cookie is sort of illegal, or contrary to the
spirit of what is a cookie jar, whatever way you put it.

Most cookies are set up by TSR (resident) programs, and they refer to something
that remains in memory. In other cases the cookie is set up by a program that
itself disappears, e.g. to install some information about the hardware that
TOS is not aware of. In all cases, the concept of being permanent is there.

In the case of one program putting and removing a cookie and another one accessing
that cookie, it cannot work (even in a single tasking environment because one
of them can be an accessory) due to conflicts. Otherwise, if there is only
one program playing with a cookie, this would be useless.

I can't see an example of a situation in which it would be meaningful to
remove a cookie.

Cheers.

For Sale:

Riebl VME Ethernet Adapters for Atari Mega STE and Atari TT030 computers

Works with Linux, BSD/Net Atari, Atari Unix System. Cards will be
supplied with TOS
drivers. $150.00 each

Riebl MegaBUS Ethernet adapters for the Atari Mega ST computers
I have only 2 of these cards remaining, all others were sold
immeadiately. $150.00 each

1 Matrix TC1208 VME graphics card (spec's unknown) $350

1 Matrix C110ZV VME graphics card (256 colors out of 16 million)
1280X960 color
at 75hz, mono 4096X4096 at 125hz $350

1 Crazy Dots VME graphics card: $350

1 ISAC MegaBUS graphics card (16 colors out of 4096) 1024X768
(duochromatic) 800X600 at 50hz: $375

Atari DMA bus Ethernet adapters: These adapters work on all Atari ST's
with DMA ports on them. These card wer built by Atari in 1990 to allow

ST's to work over ethernet. These cards require Atari ST external power supplies (not included) and I have no drivers for these cards, I have a very limited quantity of these cards: $50 each

NOTE: Attention Mega STE owners, if you intend to purchase a network or video card, please be certain that you have PALs/TALs installed near your VME bus port, if the sockets are empty you will need to purchase these chips. They can be purchased at B&C Atari Sales & Service: 916-295-9270 or www.myatari.com

Shipping: (within the contential US) is $5.00 for USPS Priority shipping

NOTE: Overseas buyers, if you are not in the contential US, shipping will be $9.00 ground (5-6 weeks) or $14 for air shipping.

Please email me if you are interested in any of the above.

]-]-No, not at all. Where precisely does it happen ? Replace one module after
]-]-the other, so that you find out which module gives you the problem.

Okay, ignore that first message, I got it wrong, it 2 bomb errors out when you run the dialer, right before you get to the point where it usually says success. I did replace the modules one by one, and the SERIAL.STX is the culprit. I'm using it right now with the other 3 new modules. BTW, with the new modules, do you have to change anything in DEFAULT.CFG or DIAL.SCR? I'm still using the same ones I've always used. Do you want me to send the DEBUG.LOG? (would it help?)

(just wanted to make sure that you knew the above paragraph applies to Single-TOS)

]-]-No. I don't know in which ways MTOS modifies the system. Maybe it's
]-]-messing with interrupts, unlinking STinG's main handler ? Does a ping
]-]-to 127.0.0.1 work, with STinG switched on in the "STinG Internals" ?
]-]-Does the Dialer get beyond the success, i.e. to the point where the
]-]-dialing window closes again ?

Okay, running under MultiTos (Freemint 1.14/AES 4.10) it calls in just fine, connects, reports success, the dialer window closes, and then I can ping 127.0.0.1 just fine. Also, I can ping the dynamic IP address thats assigned to me for this session just fine. What I can NOT do is ping anywhere else, even though my US Robotics modem's send and receive lights are both blinking like mad, the packets are only reported as going out and not coming back in...and of course in this state, if I try to use CAB or NEWSie, they just won't resolve. BTW, if I set memory protection to "on", STing errors out with a supervisor error. (I know this is probably MTOS's fault!)

Peter, this is all just for the fun of it, I know that MultiTos is a very incomplete and buggy OS, I'm just curious if I can get it to work...it is probably not really worth wasting any time over...I've got Geneva/NeoDesk, and STing works fine under it, single TOS, and MultiTos with AES 4.0. I would love to try N.AES, but apparently you can not get it in N. America, at least at this time... ;(

Thanks for all your help! ;-)

Yea, nor will I... I agree completely, but while the disk-mag authors want
shells, they are going to use them.

Yea, I agree with this to a certain extent. There are times (eg. many games)
when this is a "Must have" feature, where multitasking just complicates the
issue too much.

I have attempted to patch STOS enough so that it will happily co-exist in
a modern multitasking environment, but I dont think this is really practical
without a full re-write (not much chance of that). For now, we'll just have
to satisfy ourselves with the fact that it can be run from MiNT, and although
it will stop all multitasking, it will restore the system on exit.

The ill-fated GEMMA extension promised to allow standard AES/VDI calls
to be used from STOS - using the interpreter extension, working in such
a resolution is currently possible. The compiler extension is not finished
(and may never be finished - source is available though) allows STOS
compiled programs to be written to work with any resolution - if you are
prepared to sacrifice the speed etc. - which Tony is not.

> ST-High, but as far as I've been told, STOS software won't even run on
> that one (and that's a standard resolution, that's for sure).

Well you've been told wrong then. STOS works fine in ST-High.

Some STOS extensions, and some STOS written software does not work in ST-High
though, but you can say the same about programs written in any language.

> > another two aborted games (left the Atari scene).
>
> Are they any good?

Yea, not at all bad. I also have unfinished (what a supprise) source to
two games of my own, both running in TC mode.

Anyone who registered was sent a bunch of source, including a (very basic)
horizontal scroller in TC mode.

> > > If Tony could make "real" Falcon versions of his

> Falcon?
> Do you need to change stuff in ther as well?

Yea, unfortunately both of the two Falcon extensions do not use code-compatible
routines with TML (the best ST extension - the one Tony uses for his sprites).
TML has some odd ways of doing things, so you'd have to make an effort to be
compatible with it...

The video mode selection stuff is obviously different, and writing it so
that it handles both RGB/VGA, without access to either might be fun.

Timing issues are obviously important, and would need addressing.

> > > Just making Falcon
> > > compatible games isn't enough.

>
> I realy wonder about this. I do also recall Doug saying something like
> that, but is it true? I have never dared to try. Maybe I should. You can't find

I'd have thought that would be one of the first things you tried on
your NOVA :)

> anything
> about it in the sources? Has anyone looked?

Yea, I have. It seems to be in there - un-comment the equate "intel" (top of
DOOM.S), and reassemble. This seems to activate a few "ror.w"'s in LIGHTING.S,
just before drawing to the screen (or at least thats what it looked like at a
30second glance). I'd say that'd be pretty bloody easy to support in my Falcon
extension.

> > is definately possible. Adding it to my existing 16-bit mode routines wouldn't
> > be too hard. Actually, I have been thinking about releasing the source code
> > to my extension, so if anyone wants to try this, mail me...
>
> Someone... that is the problem. We need more "someones". :-)

yea. :-)

If you like, I'll make a version of my extension with the necessary
ror.w before
rendering to the screen, and you can try a few of my test programs in TC mode
with a NOVA. :-)

> Well, I'm not sure how it works or if it's the "VDI" who takes care of
> it or if it's the "Nova VDI" or whatever it is... Maybe I should try to find
> out.

Well neither would make a difference to STOS, as it usually bypasses the
VDI completely. Calling the VDI from inside STOS is just about
possible though...

Hmm... "N" VDI... I bet thats confusing. :)

> > Yea, well GEMMA source is available as well - anyone wanting to patch the
> > compiler so that we can compile AES/VDI stuff is welcome to try. :)
>
> Hehehe... sure. :-)

Yea. :-)

I should warn anyone wanting to try that they'll also need to hack about inside
the STOS compiler itself as well. :)

Nor me... Doing "Compilers", and "Advanced Compilers" courses at uni completely
put me off the idea of re-written STOS. :-)

> > >it, why not rewrite STOS? Anthiny has made so many patches to it so it's
> > >basicly already is a new program.

Actually, its only about 100 lines of asm added - although if you count my
Falcon extension it is just a tad bigger (its a 245k binary, with very little
static data), but most people aren't using that.

> > yet a paragrpah ago you said it probably won't happen.. and now you

Yea, but also on my Falcon - I posted to the Bad Mood list about my latest plans only last week. :)

> he even doesn't have a monitor to his Falcon anylonger. So how can you do

Now that is a bit low! You know very well that its only for two weeks. Also, I have it hooked up to a TV (although dont expect any BadC updates, as I hate working in interlaced mode, and dont particularly enjoy 768x240...)

> That should trigger Anthony off! :-)))

Hehehe... yea, that worked, didn't it? You and Tony are really a-like. :-)

> > >If it is as easy to do with STOS as it should be you don't even have to

Sadly its not as easy as it should be... I did have plans to make it this way, but its not gunna work out like that...

> completely different.

Yea. Its because the most popular extensions were coded by people without access to ST-Hi, so they didn't attempt to add support for it. Shame really. STOS provides XRES, YRES and MODE variables, but few programs check them, because TML (probably the best extension) assumes 320x200xST-Low.

STOS' own routines can be patched to work in extended modes - this is the route that the "other" Falcon extension author took - he has standard STOS sprites working in 640x480x256 etc. I chose not to go this route because nobody uses the standard STOS routines because they are slow anyway...

> So are there any interesting pieces of software in STOS that were written
> with ST-High in mind (or even better resolutions still) ? I'd like to give
> it a try.

Well, GEMMA comes with an example of a GEM program in STOS, which should work in any resolution, and maybe on various bits of kit. Its still rather flaky though, and I wouldn't bet it running cleanly everywhere (although on the GEMMA homepage there is a picture of it working under AES 4.1 in 768x480x16 on a Falcon).

There is very little software using ST-Hi, as people quickly realised that the extensions were better than the standard STOS commands, and sadly these lacked support for different resolutions.

As for extended resolutions, well this is currently Falcon only, appart from via GEMMA. For the Falcon, you can get a FLI+MOD player, and a few other bits. Sadly, most things that I've heard about dont ever get finished...

What a strange way. It's like, if you want to pass a pointer *p, you'd
write &(*p) instead of just p. (cp-1) is fine.

>>Hi,
>>
>>How to programm bubblegem with GFA basic 3.xx ?

Dunno but it ain't that hard!

>I could do with wanting to know that too...

The following is fairly easy to follow ...

```
#include <gem.h>
#include <evnt.h>

#define  BUBBLEGEM_SHOW    0xbabb
#define  BUBBLEGEM_ACK 0xbabc

static EVM    evm;
static bool   done =false;
static int    apid;

static void
Hndl_MESAG()
{
 switch (evm.evm_msg[0])    {
     case WM_CLOSED:    done = true;  break;

     case BUBBLEGEM_ACK:
     Form_Printf(NIL,NIL,2," Got BUBBLEGEM_ACK ");
     break;

     default:           break;
 }
}

static void
Hndl_BUTTON()
{int msg[8];
 char    *bubble_text  ="F**k me, it works!!";
 int bubble_id =appl_find("BUBBLE  ");

 if (bubble_id < 0)    {
     Form_Printf(NIL,NIL,5," BUBBLEGEM ain't loaded yer plonker!
\n");
     return;
 }

 msg[0] = BUBBLEGEM_SHOW;
 msg[1] = apid;
 msg[2] = 0;
 msg[3] = evm.evm_mousex;
 msg[4] = evm.evm_mousey;
 msg[5] = (WORD)(((LONG) bubble_text >> 16) & 0x0000ffff);
```

```
 msg[6] = (WORD)((LONG) bubble_text & 0x0000ffff);
 msg[7] = 0;
 appl_write(bubble_id, 16, msg);
}

main()
{uint    ev;
 int msg[8],
     wh;
 Rect    wr   ={150,150,150,150};

 apid = appl_init();

 /* replace with suitable event_multi code */
 ev = Evnt_Multi(&evm,true,msg);

 /* enable detection of right mouse button */
 evm.evm_event |= MU_BUTTON;
 evm.evm_button = 0x0003;
 evm.evm_bstate = 0x0000;
 evm.evm_clicks = 0x0102;

 /* kludge up a window with no contents */
 wh = wind_create(CLOSER,wr);
 wind_open(wh,wr);

 /* basically, wait for closer or right mouse button */
 do  {
     ev = Evnt_Multi(&evm,false);

     if (ev & MU_MESAG) Hndl_MESAG();
     if (ev & MU_BUTTON)    Hndl_BUTTON();
 }while (!done);

 wind_close(wh);
 wind_delete(wh);

 appl_exit();
 exit(0);
}
```

ie: Use appl_find() to find if bubblegem is loaded (the trailing spaces *are* important). If it exists send it the following message ...

```
 msg[0] = BUBBLEGEM_SHOW;
 msg[1] = apid;    /* your application id */
 msg[2] = 0;

 /* current mouse position (hotspot) */
 msg[3] = evm.evm_mousex;
 msg[4] = evm.evm_mousey;
```

```
 /* upper word of message text */
 msg[5] = (WORD)(((LONG) bubble_text >> 16) & 0x0000ffff);
 /* lower word of message text */
 msg[6] = (WORD)((LONG) bubble_text & 0x0000ffff);

 msg[7] = 0;
 appl_write(bubble_id, 16, msg);
```

The message now displays at the current mouse position. It goes away when the mouse is moved a few pixels away from the current position (hot spot). At this point you get the BUBBLEGEM_ACK message back from bubblegem.

In pseudocode nothing more complex than this:

```
apid=APPL_INIT
bubble_id=APPL_FIND("BUBBLE  ")
APPL_WRITE(bubble_id,msg[])
WAITFOR BUBBLEGEM_ACK
[continue program]
```

> Same idea, same stupid things.

While I agree of course on the latter example, I do not completely agree on the first statement. It's certainly true that STinG is more fun on MagiC (for MagiC's advantages, STinG is the same on both MagiC and MiNT), and it's true as well that MiNT and MiNTnet have the benefit of being more servers (and a bit more clients too) available. But I can well imagine the situation that someone would want to run STinG on MiNT. MagiC costs money while MiNT is free. And there is neither a GEM based Telnet nor a GEM based IRC client for MiNTnet, while there is two of each for STinG.

Sure, if one is free to dismiss GEM entirely, MiNT/MiNTnet would probably be the choice.

Cheers Peter

Where did you get the impression that I'd run off ?

And I'm not exactly a STOS hater. I'm merely fighting the assumption that everybody has ST-Low in his machine. This assumption is so dead wrong, I don't know how one could be so narrow-minded and just ignore all the recent (i.e. the last five years) developments on Atari hardware. It just happens that a fair lot of STOS programmers seem to share this assumption; this and your habit of feeling personally insulted if one utters negative criticism regarding STOS made you believe that I'm a STOS hater.

This silly assumption leads for instance to the situation of diskzines that a fair percentage of all Atarians cannot read, simply because they haven't got ST-Low. I'd be interested in reading them, but I can't, and this is truely annoying.

It's just not true that every Atari has ST-Low. But there is a thing that every Atari indeed has, that is GEM. Make your software use GEM, and everybody will be satisfied. I'm not saying AES should be used, with VDI alone the appearance, the look and feel of the software can be preserved, gaining the huge advantage of leaving everybody capable of using the software.

>>> >If you used VDI it would be no problem. You could even make them run in
>>> >a GEM window. ;-)
>>>
>>> tsk...GEM....you love GEM so much....how sad :(
>>
>>The reason is simple. It works.
>
> Yep great for a nice WP... not so great for an 8 way scrolling
> platformer.....

Stupid crap. This is the prejudice of someone who refuses to try decent GEM software (interesting to note here, as you are complaining about us not

trying STOS software). I suppose you never even tried to program a decent game using VDI. I've seen a few games that use both VDI *and* AES, and that are still fast enough (using NVDI) to make many games directly accessing the video hardware look old and outdated.

There is a saying in german computer science. A programmer saying that his hardware or the OS he's using is too slow to run his software, he is usually meaning that he's too stupid to optimize the code.

Cheers Peter

Which TOS version is that that CAB did not like ?

Cheers Peter

> v_box() to draw the cursor.

You mean v_bar or vr_recfl? Anyway, the method you suggest is the only way, I'm afraid.

John.

>Where did you get the impression that I'd run off ?

 Your reading you mail out of order, the above was posted BEFORE
others you have replied to.. is this more of your silly games to try
and make yourself look clever... tsk :(

>
>And I'm not exactly a STOS hater. I'm merely fighting the assumption that
>everybody has ST-Low in his machine. This assumption is so dead wrong, I

 Duh!....No one is saying or assuming all machines have ST-Low.. This
is why I tell everyone that my software will run on blah blah machines
with ST=Low.....Your the one moaning..not me?

>that a fair lot of STOS programmers seem to share this assumption; this and
>your habit of feeling personally insulted if one utters negative criticism
>regarding STOS made you believe that I'm a STOS hater.

Its not the fact that people don't like STOS..thats ok.. I don't blame people for not liking it sometimes :), It is people like you who know so little about it... and try to tell everyone how it works...I hate the way people saw STOS 10yrs ago and for some reason think it is the same....

If you can for one moment take your head out of the sand you will see that STOS games are good, it is only a small.. very small percentage that dont have access to st-low... I always state my software (games) run from st-low.. I make other software to run from med and high... I suppose you also havnt seen my page .....

I never suggested my games would work on any other screen resolution and this whole argument started because you missquoted me and printed lies about what i had said.....I am not defending stos.. I am defending your attack on my software.....

>
>This silly assumption leads for instance to the situation of diskzines that
>a fair percentage of all Atarians cannot read, simply because they haven't

a fair percentage..... I think you mean a samll percentage ?

>It's just not true that every Atari has ST-Low. But there is a thing that

we know that

>every Atari indeed has, that is GEM. Make your software use GEM, and every-

GEM ... show me a game like the ones I make. that works in GEM ?,

: Why not? Because someone hasn't done it it's not said that it can't be
: done,
: atleast with a decent box with a graphics card. On a ST it wont be
: possible
: if you don't use mono mode and maybe even then it can't be done.

Of course you are right that it can be done. Admittedly I don't have
anything real to back this up, only a couple of simple GEM games
(Asteroids and Pacman, see my WWW page) but then I'm no games programmer,
these are the first two games I've ever written. I do plan on writing a
real-time platform type game for GEM sometime, maybe you will believe it
then when you see it :-) But I have lots of other more important things to
do, so it might be a while before you see this game.

I can't even understand why anyone could think that such a game cannot be done under GEM. Could someone explain why everyone believes this? I would like to understand what this is that I'm missing here, that makes it perfectly possible for me, but nobody else. (Except Magnus?)

Also...
I don't want to go into this again (after what happened last time...) but everybody seems to me missing the point completely so I think I must answer at last: Tony keeps saying that STOS is great and it works on any machine and all that... but the fact is that if the program was done like it should be done then it would truly work on any machine. Under STOS it has to be patched to suit every new machine. It should simply be that the software would work on any machine, whether it's an ST, Falcon, Medusa or a machine that does not exist yet, and no patches would be needed at all. You would know this without even having to try it on such new machines. This is surely the real point, isn't it?

Tony always mentions that he cannot write a "Falcon enhanced" game with better than 16 colour graphics because he doesn't have access to a Falcon. But the fact is you *don't need a Falcon* in order to write a game that has better graphics. Tony's PC would be perfect for drawing the graphics with. If it's done the right way, the better graphics will then work on any machine that has a suitable graphics mode whether it's a Falcon or not. You don't even need to test it in order to know this. (Of course it won't hurt to test the software on a variety of machines just to ensure there are no bugs that only show up in certain situations, but this doesn't change the fact.)

That's not to say that Tony's games are no good. I never play games so I cannot comment on this, but it does seem to me a pity that these games are so limited by the language they are written in, and that Tony refuses to believe this...

Well I think that's enough for now. I hope it doesn't cause too many bad feelings.

>machine and all that... but the fact is that if the program was done like

 NO I DO NOT... You of all people suprise me.. I can not see why you
would utter such lies in a public newsgroup.. Please show me any
message, in here or on the STOS list where I have said STOS will work
on any machine, I have never said this.. why are you telling everyone
I have ?

>Tony always mentions that he cannot write a "Falcon enhanced" game with
>better than 16 colour graphics because he doesn't have access to a Falcon.

 Correct..

>But the fact is you *don't need a Falcon* in order to write a game that

Ho dear... HOW WOULD I KNOW IT WORKS!..what programmer releases
software that he has not tested ????????? THINK MAN...THINK!

>has better graphics. Tony's PC would be perfect for drawing the graphics

IF YOU HAVE THE GOOD MANNERS TO READ THE MESSAGES IN THE THREAD YOU
ARE POSTING TO you will see that I already wrote I can not do
artwork.. It was a hard job finding a good artist and he only has a
ST... please read the thread ?

>with. If it's done the right way, the better graphics will then work on
>any machine that has a suitable graphics mode whether it's a Falcon or

 yeagh yeagh... and all you have to do to make a falcon enhanced game
that works on a fm and a falcon 040 nova blah blah blah is draw 256
colour pictures is it?... get real :(((

>not. You don't even need to test it in order to know this. (Of course it

 This is where you argument falls over....what happens if you dont
test it.. and you got soemthing wrong.. its stupid.. please dont tell
me to do stupid things.. software should be tested.. and you coming
into a programming forum and saying we should release software without
testing is real silly when you think about it...

>That's not to say that Tony's games are no good. I never play games so I
>cannot comment on this, but it does seem to me a pity that these games

 ho ffs... another know all who hasnt tried it... this newsgroup is
full of people who want to comment about my software.. but havnt tried
it... how clever of you all...

>are so limited by the language they are written in, and that Tony refuses
>to believe this...

 what!!!!!!! where does this come from!, how can you post such lies
about me.. how can you tell people what i think...how insulting!,

>Well I think that's enough for now. I hope it doesn't cause too many bad
>feelings.

your joking.. you enter a thread you have not even had the good
manners to read, you post lies about me... and hope theres no bad
feelings...amazing :(.... go make up some lies about perverts and
spammers... dont come here making lies up about people trying to
support ATARI.... I never said or even think the things you have
posted... :((((

I dont believe a game like Tonys can be done on a plain 8Mhz ST using the VDI. When I say like Tony's games, I MEAN like Tonys - ie. not "mono only" and with other limitations. Perhaps Hans could take his C based heartland clone, and replace whatever libraries he used for gfx (ST-low dependent) with VDI calls, and then we would see.

> these are the first two games I've ever written. I do plan on writing a
> real-time platform type game for GEM sometime, maybe you will believe it
> then when you see it :-) But I have lots of other more important things to

Yes, please do. I'd like to be proved wrong... but I dont believe it can happen...

> I can't even understand why anyone could think that such a game cannot be
> done under GEM. Could someone explain why everyone believes this? I would

Well, in my experience, the VDI simply isn't quick enough. The routines that Tony uses are optimised specifically for the video mode, and do not have to be general purpose etc.

I admit that I have not profiled the VDI, but you cannot tell me that the nice generic routines in the VDI are going to be anywhere near as fast. Particularly if you use Atari's VDI, rather than NVDI (plain standard ST, remember).

> like to understand what this is that I'm missing here, that makes it
> perfectly possible for me, but nobody else. (Except Magnus?)

If you read his post above, even Magnus doesn't believe games like Tonys are possible on a plain ST.

On a Falcon, TT, or other machines, yea, fine, I agree that the VDI is probably fast enough... but not on an 8Mhz 1040 ST. Hell, a 1Mb machine hasnt even got enough memory for some of Tony's games if you have NVDI installed.

> Also...
> I don't want to go into this again (after what happened last time...) but

Hehehe

Provided it supports the defined XBIOS calls (eg. Setscreen for changing to ST modes) then it will work. "fixing" is not required for new binaries, as the table that fixing has always patched is now calculated on startup by my loader code.

> software would work on any machine, whether it's an ST, Falcon, Medusa or
> a machine that does not exist yet, and no patches would be needed at all.

If its ST compatible, it will. If it is not 100% compatible, then surely you should sometimes expect problems? (I mean at the TOS call level, not hardware level).

TOS version shouldn't make a difference any more, as the TOS version dependent table is now generated on run-time.

> Tony always mentions that he cannot write a "Falcon enhanced" game with
> better than 16 colour graphics because he doesn't have access to a Falcon.
> But the fact is you *don't need a Falcon* in order to write a game that

he is not the artist.

> with. If it's done the right way, the better graphics will then work on
> any machine that has a suitable graphics mode whether it's a Falcon or
> not. You don't even need to test it in order to know this. (Of course it

You are assuming that the libraries that are available support multiple resolutions, or that there are call compatible libraries. As has already been mentioned in this thread, this is NOT the case, sadly.

This *would* have been the case, if I'd had any feedback when I proposed to make a call compatible extension about 1-2 years ago. Lack of feedback to programmers is slowly killing the Atari market, IMO.

> won't hurt to test the software on a variety of machines just to ensure
> there are no bugs that only show up in certain situations, but this
> doesn't change the fact.)

I find it amaizing that people are suggesting that Tony writes a game he cannot test. Try writing a BBS system without a modem, internet applications without a TCP/IP stack, or a 3d model viewer without any 3d models.

> cannot comment on this, but it does seem to me a pity that these games
> are so limited by the language they are written in, and that Tony refuses
> to believe this...

It is limited, but not as limited as some people have portrayed here. How many people dont have access to ST resolutions? well, there are:

* medusa owners (presumably)
* hades owners (presumably)

  * directt owners (presumably)
  * Falcon+nova owners (although magnus indicated that he is able to
disable it)
  * ST owners who have made custom modifications to the video hardware
  * any others I've forgotten?

Is anyone here saying that these people are a major factor in the Atari gaming
market? I dont believe they are.

> Well I think that's enough for now. I hope it doesn't cause too many bad
> feelings.

Not from me, and Tony is not as wound up as he makes on - he just likes an
argument. :-)

Anthony

>(for MagiC's advantages, STinG is the same on both MagiC and MiNT), and it's
>true as well that MiNT and MiNTnet have the benefit of being more servers
>(and a bit more clients too) available.
a bit? just a bit?? ;) you are exagerating here.

>But I can well imagine the situation
>that someone would want to run STinG on MiNT. MagiC costs money while MiNT
>is free. And there is neither a GEM based Telnet nor a GEM based IRC client
>for MiNTnet, while there is two of each for STinG.
I agree, however I don't see the relation where you would replace
mintnet by stik, sting etc, but well :)
irc client? are you talking about atarirc and fracirc?
If yes, I don't see/have any problem here with these client, ever
heard/used gluestik? Redirect stik/sting calls to mintnet ones.

>Sure, if one is free to dismiss GEM entirely, MiNT/MiNTnet would probably
>be the choice.
hm Just for the mintovl for cab, it is worth it in GEM. 2) Aftp
doesn't have any equivalent in stik/sting, Even Aftp version for stik
doesn't work correctly. Only the mintnet version works like it shold,
like an ftp program should. And Aftp is gem afaik :)

>Cheers Peter
cheers, in any case, sting is a great program, keep up the Excellent
work.
1 good point sting has over mintnet is ip masquerading.
2 that it works with singleTOS machine
3 easy configuration, installation

That's it, no need to try to find the BAAAADS of mintnet or find the
gooood of sting. Like saying no GEM prog, etc, that's just not a good
argument :) if you want to defend sting, pick some of the 3
arguments I just said 8 lines above :)

I've been following the discussions between Tony, Magnus, Peter etc. with some interrest. Ever since I got my first Atari (a "stoneage" 520ST) the problem with different resolutions has been a constant source of irritation. Things got somewhat better when I bought a Falcon, but regarding games the problem was still there: I download a new flashy game only to find it requires some bizzarre resolution that aren't even described in the docs.

Now I've got a TT with a CrazyDots graphics card and the situation is even worse than on the Falcon regarding games. Only GEM stuff works...

On the Falcon, there were a *few* nice exceptions. Some programmers were actually making games with CLEAN res-changing routines that made the game run directly from the desktop, change res and restore the original res on exit. A couple even worked fine under Magic. Some such games spring to mind: CRAPMAN, Martin Steen's HI-color games and good old STONEAGE always worked without having to reboot, change monitor etc. (I've also tried some STOS games without sucess..)

In order to make this hopeless situation better, I asked a friend to code a res-changer for the Falcon (I'm unfortunately not a programmer). The tool works by being installed as an application for different extentions, i.e. *.PR1 for ST low res, *.PR2 for med res and so on up to *.PR6 for Falcon high color (32k), runs the game and switches to the desired resolution according to the extention and restores the original res on exit. The first beta's of this res-changer worked fine with ST-low/med games renamed to the *.PR1 and *.PR2 extentions but had problems with the other res'es. Unfortunately, the programmer became too busy to continue developement of the tool and I've searched for someone to take over - so far in vain. But I've got source code for res-changing routines from Martin Steen, from the author of Crapman and from Guillaume Tello (M-player). And the sources for the res-changer, of course.

So instead of continuing the quarrelling that goes on here now, I hope some programmer would take an interrest in the res-changer project and continue development. If the program could be fixed for other res'es as well as those that already work, programmers wouldn't have to worry about writing res-changing routines into their games, but could use this external tool instead. If it could also be extended to work with graphics cards (if this is at all possible) it would be great.

So let me have some feedback on this idea - I've got the sources right here if anyone is interrested...

 - Petter -

Hello,

I'm research some information about cookie jar. In fact I want to know the structure of some cookie. For example, about DEPI, or Edi. If you have a lot of information about all the pointer structure of cookie jar, thank's for your answer.

Best regard.

Ok, maybe you didn't say those exact words. That was not my point at all.

: >But the fact is you *don't need a Falcon* in order to write a game that

: Ho dear... HOW WOULD I KNOW IT WORKS!..what programmer releases
: software that he has not tested ????????? THINK MAN...THINK!

Well I don't test my software on all possible machines, that is not possible to do. Especially when these machines do not exist yet. Yet it still works in any graphics mode.

: >has better graphics. Tony's PC would be perfect for drawing the graphics

: IF YOU HAVE THE GOOD MANNERS TO READ THE MESSAGES IN THE THREAD YOU
: ARE POSTING TO you will see that I already wrote I can not do
: artwork.. It was a hard job finding a good artist and he only has a
: ST... please read the thread ?

Yes, but that is not relevant to the point that I was making, that is that you don't need a Falcon in order to make a game with graphics with more than 16 colours.

In fact you can draw graphics with more than 16 colours on an ST (any decent graphics program supports this) although it would be more difficult to visualise the result since the dithering required can obscure the picture somewhat.

: >with. If it's done the right way, the better graphics will then work on

: yeagh yeagh... and all you have to do to make a falcon enhanced game
: that works on a fm and a falcon 040 nova blah blah blah is draw 256
: colour pictures is it?... get real :(((

Well it is for all the software that I write. That is what I am trying to say, that it is entirely possible to write software that works in any graphics mode. This is what everybody seems to be missing here.

: >not. You don't even need to test it in order to know this. (Of course it

: This is where you argument falls over....what happens if you dont
: test it.. and you got soemthing wrong.. its stupid.. please dont tell
: me to do stupid things.. software should be tested.. and you coming
: into a programming forum and saying we should release software without
: testing is real silly when you think about it...

That's right, that's why I said that it should still be tested (now it's you who is mis-quoting me...) I think it's easy enough to send the software to a Falcon owner to make absolutely sure it works on that particular machine. The point is that unless you made some other error, which you could just as well have made if you were not using 256 colour graphics, then it would work. You'll only ever need to try it once. I think you'll agree that it's easy enough to do this.

: >That's not to say that Tony's games are no good. I never play games so I
: >cannot comment on this, but it does seem to me a pity that these games

: ho ffs... another know all who hasnt tried it... this newsgroup is
: full of people who want to comment about my software.. but havnt tried
: it... how clever of you all...

I'm not commenting on your games so much as the possibility of supporting
different graphics modes.

: >are so limited by the language they are written in, and that Tony refuses
: >to believe this...

: what!!!!!! where does this come from!, how can you post such lies
: about me.. how can you tell people what i think...how insulting!,

Sorry, but this is how it appeared to me.

: your joking.. you enter a thread you have not even had the good
: manners to read, you post lies about me... and hope theres no bad
: feelings...amazing :(.... go make up some lies about perverts and
: spammers... dont come here making lies up about people trying to
: support ATARI.... I never said or even think the things you have
: posted... :((((

I'm not trying to make up lies about you, and I did in fact read every
single message in the thread. I think it's great that you are supporting
the Atari. I'm just trying to clear up this misconception that everybody
seems to have, see above. And if you would make your games have improved
graphics and proper compatibility then that would be even better. Maybe I
would even play them then... as it is it's too much bother for me to have
to dig up an old ST just to play a game.

Yea. Probably because Atari didn't think about it when they defined
how you change resolution - each machine/upgrade has a different way
of doing it...

What would be nice would be a standardised method of enquiring/setting
video modes, that could be retro-fitted to old machines, and supported
by any new hardware.

> Falcon, but regarding games the problem was still there: I download
> a new flashy game only to find it requires some bizzarre resolution
> that aren't even described in the docs.

Thats because the videl is cool, in that if you fiddle with the registers
you can make your own resolutions. If you dont correctly set all of the
registers, then problems occur (eg. some games cannot cope with being
run from ST compatibility modes). You may have seen problems when changing
to/from MONO modes - there is (apparently) a problem with setting the
registers in an "incorrect" order... not all routines get it right.

> Now I've got a TT with a CrazyDots graphics card and the situation
> is even worse than on the Falcon regarding games. Only GEM stuff
> works...

Thats because only GEM stuff knows what resolution/system you have. Eg,
how would a standard ST game know how to restore the Crazydots screen mode?

> On the Falcon, there were a *few* nice exceptions. Some programmers
> were actually making games with CLEAN res-changing routines that made
> the game run directly from the desktop, change res and restore the

Well, all the best programs will do this. There are problems regarding
extended screen resolutions sometimes, and with STOS I have found problems
with NVDI when using standard ST compatible setscreen calls on a Falcon.

> A couple even worked fine under Magic. Some such
> games spring to mind: CRAPMAN, Martin Steen's HI-color games and good
> old STONEAGE always worked without having to reboot, change monitor etc.
> (I've also tried some STOS games without sucess..)

New, or old? Those compiled with the last "official" release of STOS are
not Falcon aware, so only use setscreen() to set/restore the screen, and
so drop you in a sort-of ST compat resolution on exit.

From STOS 2.07 beta 1 to beta 3, vsetmode() was used (or was it vsetscreen?)
when a Falcon was detected - which worked with both extended resolutions
(via BlowUP etc) and standard Falcon resolutions. Problems are encountered

when NVDI is installed with these versions.

From STOS 2.07 beta 4 (aka STOS 2.08) the videl registers are stored directly, and so it will exit cleanly, even if NVDI is installed. This is not yet released, due to a bug introduced elsewhere into the code.

> programmer). The tool works by being installed as an application for

> restores the original res on exit. The first beta's of

Sounds a bit like backwards, or simular, only not handling features other than resolution changing.

> continue development. If the program could be fixed for other res'es
> as well as those that already work, programmers wouldn't have to worry
> about writing res-changing routines into their games, but could use

Well, with STOS they dont have to worry about it, as it is all built into the bootstrap code in STOS.

> this external tool instead. If it could also be extended to work with
> graphics cards (if this is at all possible) it would be great.

Anyone with details of how to change/restore video modes with graphics cards is welcome to contact me, and I'll include it into the next release of a patched STOS.

> So let me have some feedback on this idea - I've got the sources right
> here if anyone is interrested...

Sounds like a good idea - a positive response. Thanks. :-)

Anthony

It happens that I've been looking for this particular file today. Haven't found it though, so if anyone has this file, please send it to me in e-mail (error@euronet.nl). The file was composed by Dave Baggett, whom some of you may remember for his many posts about the downfall of atari ;-) Of course he had also been screwed by Atari on the game development system he had written for the Atari and specifically the Falcon.

Cheers,

Erlend.

>I doubt very much that the upcoming Milan will have ST-Low.

ST low is a crappy standard that must be maintained. I didn't know that Hades didn't support it. Your Mega ST must have it, just not available depending on your monitor? If you alter you machine to not have ST low, that is different.

Now TT low, there is a standard that really caught on:-).
Anyways, ST low provides a commonality between the TOS platforms for low res colour.
>
>BTW Have you ever considered that for many many people, whose machines really
>do have ST-Low, it's a real hassle to switch to ST-Low ?

Now thats a stretch. Its a pain, but not a hassle. Also many programs can be launched from Medium Resolution to Low Resolution, such as CAD 3D and Cyber Paint, (all of which are TOS 2.0 incompatible:-).
I boot to ST low for pretty pictures, and was hoping to use a Viewer in CAB that shows pictures in low res for the most colour, while using Cab in med res. Since I am using Hi res now, I have not bothered doing it yet:-).

>I still have a 1040
>machine with ST-Low, but I'd need to carry it around and probably find a TV
>set to connect it to, because I (and never of my local friends) do not have

Well, colour monitor may not be very good, but you can find them very very cheap, time for a downgrade. Grab one and enjoy:-).

>A diskzine that uses STOS is crap for me, I cannot read

By DMA, do you mean ACSI, the Atari hard disk port? Do you at least have
the manual or the data transfer spec? And does anyone know of any
drivers for TOS or, more importantly, Linux or MintNet support?

Dan

Have anyone got a webpage with links to all games available on the
web/ftp?
That would be a neat idea, like a games index there you can download all
games available and a short description.

> Anyone who registered was sent a bunch of source, including a (very basic)
> horizontal scroller in TC mode.

I wonder if anyone did anything with it.

Ah, that was what I was after. So it's not that easy to parot them to
the
Falcon in a decent way. Bad. :-(

> Timing issues are obviously important, and would need addressing.

Yup, would not be that funny otherwise to play.

> > Exactly. Talking about games, I tried Lotus 0.6 yesterday and this

It's a new cool game (does not work very well on my AB040 though).
Something
like all those car racers on the Playstation or something like OutRun
but
with nice graphics and texture mapping. Actually looks very nice indeed.

> extension.

Aha, that I have to try. I guess I have to launch in in TC mode then as
well,
but that sounds like it could work. I did not know that I had to
recompile it
in order to get it working. Sounds cool and I hope it works! I got to
download
the sources first....

I must figure out how to change res on the Nova so that new programs can
support
it.

If oyu know of any GEM games, couild you point me at them? I did find a
rather nice 3D maze running in a GEM window, but it was not finshed
and not realy fluid (it worked like Dungun Master. It would be nice
to see if the author had made it move in smaller steps. It was very
fast in the current way.

Yeah, sounds cool. I would love to see that platform game. Are the other
two
games using colour sprites? I have found a couple of GEM games but they
are all using mon sprites. Not that cool when you have got a 24-bit gfx
card! Atleast 16 colours should be used, or better, use as many colours
as you have and dither them at loading. :-)

Oh I tried you webpage below and I got "hostname unknown". :-\

Just what I was trying to say.... but apperently it's not that easy as
STOS is such a patched language that it's almost impossible to make
something
which works on all computers without to much hassel.

Ofcourse can't everything be done in GEM but most things could if you
have got
a fast ebnough machine, like a Mac running MagiC MAC and a TOS clone.

> > I can't even understand why anyone could think that such a game cannot be

Ataris VDI will be way to slow. Now when Johan in working on the next
generation
VDI called fVDI, why not put in some optimized routines for games? So to
make
it work on any TOS box you just install fVDI and the correct driver and
off you go.
Should be possible to make some speedy routines in there especially for
games.
Maybe an extension to fVDI and why not OpenGL support with the help of
Doug. :-)

Hehehee... :-)

> > like to understand what this is that I'm missing here, that makes it

Well a 8-way scrolling game is a bit much.... but still with a fast
enough
computer. :-)

Hwy I just manged to get on your webpage.

Shit, this looks cool! I will try them as soon as I get home. Make my
own
PacMan look like a joke. :-)

Great stuff!

Just realized that I can't download any of them. :-((((
Is there a "futuristic" look for Asteroids as well? Filled coloured
polygons
maybe?

Hello, If you want someone to make some greate graphics for falcon games and

ST games then send messages to billschool@rmplc.co.uk I have a falcon and an ST, both with Magic5 and two hard disks, I don't know many other atari people around here (essex, Uk).

I am also a keen MIDI ZAP fan and have tried to regester it, where does the author live now? i got no reply!!!

Thanx in advance

Ninja Badger :-) (ian norton-badrul)

At last someone realises that it is NOT just a case of changing the graphics to 256 color ones.. maybe other people can start to realise this.. Just having 256 colour gfx does not make a falcon enhanced

game.. at last you are starting to see the light :)

KAOS 1.4.2, on a 1040ST, 20MHz 68000, 4Mb RAM and SCSI
harddisks. CAB loads, says clunt and it's time to hit
the reset button. It did work with 1.04, but that
TOS version has too much problems with the amount
of folders on my harddrive. So it WAS bye bye CAB, have
a nice trip to my trashcan.

Bye, Hans

> with VDI calls, and then we would see.

The gfx library doesn't exist. They are just routines writing
directly to the screen, just the way I would do it in assembly.

The way of getting it into a GEM window is using a routine
converting the screen output into a datablock that can be
used by the VDI. Machines with grafix cards are usually
power full machines, having enhough processor time to
convert an ST LOW screen into VDI output every VBL.

> On a Falcon, TT, or other machines, yea, fine, I agree that the VDI is
> probably fast enough... but not on an 8Mhz 1040 ST. Hell, a 1Mb machine hasnt
> even got enough memory for some of Tony's games if you have NVDI installed.

That's a problem on Tony's side. If you get into Heartland
you will find that all background sprites are preshifted
on nibble level. Tony is using only the on byte level
preshifted sprites, so that's 2*2*128*16*16
(2 preshifts, sprites plus backgrouds, 128 sprites
16 lines per sprite, 16 bytes per line= 128k wasted).

There are serveral other structures used in Heartland
that could be done more memory efficient.

I think the C version will work in half a Meg, but never
tested it.

> It is limited, but not as limited as some people have portrayed here. How

> * ST owners who have made custom modifications to the video hardware
> * any others I've forgotten?

All ST owners using a high res monitor. The ST they are using can
generate ST low, but the monitor wont display it. Those having
a ST with modulator can go to their living room with their ST to
plug it on their television set but I don't think that's a
workable situation, especially not when the ST is nicily
installed in their midi installation.

> Is anyone here saying that these people are a major factor in the Atari gaming

So ST LOW is the only resolution to do the real stuff. Doing other
resolutions is possible, but the great extensions you need for
the games Tony is talking about are missing. Tony doing Heartland

with the same features in ST high (profided he has got the
right graphics) is not possible (he has ST HIGH with Pacifist
on is DOS computer so that can't be the limiting factor).

If you write me a routine that should be called with:

```
void do_the_vdi(char* screen, char* colors)
```

ingoing:
screen: a pointer to 32000 bytes containing the
  screen in ST LOW format that has to be transfered
  to the VDI screen.
colors: a pointer to a color table in ST register format.

I can make you a game running on every resolution.
If I may snatch all intterupt vectors I might
even do a conversion of crapman.

Not that I know of. I have a "games" section in my download bay, but these
are just selected games, not a definiative list.

> That would be a neat idea, like a games index there you can download all
> games available and a short description.

Yea, a nice idea.

> > Anyone who registered was sent a bunch of source, including a (very basic)
> > horizontal scroller in TC mode.
>
> I wonder if anyone did anything with it.

I doubt it - it was mainly intended as a demo of how to do it (using hardware
scrolling), rather than a "game engine".

> > Yea, unfortunately both of the two Falcon extensions do not use code-
compatible
> > routines with TML (the best ST extension - the one Tony uses for his sprites).

Yea, a shame eh? I wish I had time to do something with FML, but I just
couldn't justify it...

> > Timing issues are obviously important, and would need addressing.
>

Yep. This is a big reason why coding a game blind is not really feasable.

> > > Exactly. Talking about games, I tried Lotus 0.6 yesterday and this

Damn annoying that doug ignores our requests for the 3.07 source... I think the
source on rand is way out of date - if you want 3.06 I'll upload it to johans
site.

> I must figure out how to change res on the Nova so that new programs can

Well, the changes necessary should be fairly portable from the interpreter version, although the compiler is NOWHERE near as well commented...

> lot of information about all the pointer structure of cookie jar, thank's
> for your answer.

It's pretty basic. Address $5a0 contains a pointer to the first entry in the cookie jar (it contains NULL if no jar exists). The jar itself is simply an array of cookies. Each cookie is simply two longs, the first of which is interpreted as four characters being the name of the cookie (for instance 'STiK' is a cookie, the first longword is $5354694B), the second is simply a long the meaning of which entirely depends on the cookie itself. The cookie list is terminated by the Null cookie, for which the name is 0L, and the value (the second longword) is the number of entries the jar can hold.

In C :

```
typedef struct cookie {
    long  name;
    long  value;
 }
```

```
COOKIE  jar[];

$5a0  contains   (long) & jar[0]

So create a new jar by

COOKIE  jar[NUM_ENTRIES] = { 0L, NUM_ENTRIES };

* (COOKIE **) 0x5a0 = & jar[0];

(Execute the latter line in Supervisor mode !)

Cheers  Peter

Does someone have a list for games for the following systems:
400, 800, 2600, 5200, 7800?

Thanks,

Eric

> Why ? Why shouldn't I add RAM at those addresses ? Neither of my machines
> has ROM there. The only reserved bit is the area beyond $ff0000 (and
$ffff0000
> on 680x0 CPUs). Everyone who puts RAM there violates specifications by
Atari.

hello peter,
i must say what you're telling is not exactly
true,many computers have ROM at $e00000,
because since STE machines (tos1.6) the tos
is between $e00000 and $effff f (256 Kb on
tos 1.6 and 512 Kb for the later TOS 4.0x)
so,if you put RAM there,you break Atari specs !!
for older machines such as STF, the address
of Roms was $fc0000,so if you put ram there
some old software may not run properly.....
in fact,there is no interest in putting ram there
because it's a small area !!
anyone putting ram in the $ffffxxxx zone does
NOT violate atari specs , this zone is the I/O
zone,and there is no problem to handle RAM
as i/o , such as video memory for video
cards as a simple example !!

wrong also:
the only reserved bit is NOT $ffffxxxx
because on the Falcon030 hardware map
the IDE port is at $fff0xxxx !!!
in fact ,according to Atari, the I/O zone
is any adress with bit 31 set, since the
68030 machines i.e from $80000000 to $ffffffff
this is handled with proper setting of
the TT0/TT1 pmmu registers in the boot
code of tt030/falcon030 TOS...

> BTW.: The only way the CPU is affected by the bus error is that the state
is
> set to Supervisor mode. That's all. Concerning memory, some info is

placed
> on the system stack, you gotta remove it for recovering from the bus error.
> You also need to restore the status register, which is part of the saved info.

well,you seem to like simple things :)
bus error is the most complicated exception
procedure on 680x0 processors, so complex
that there are several formats for it...
informations stored on the stack are very
important,it's not correct just removing those
from the stack !!!!! you absolutely need to 'RTE' !!
the state of the pipeline stages and other internal
registers of 030 are stored there so if you
don't get back correctly, your pipeline will
crash...also you must know that a 68000 bus
error and a 68030 (and later) bus error are
definitely not the same !!! just because the
recent processors have a Pmmu and the
handling of memory faults is much more
complex ! Do you know ONE single instruction
on the 030 can cause up to TEN bus errors !!!
so do you really think it's simple to handle ????
everybody knows that anyway exception
stackframes are just not the same size
since 68010 so it's silly to tell it's exactly
the same way on a 000 and a 030 !!!

the correct answers to the guy are:
YES,you CAN stop testing memory at 14Mb
BUT it's just STRAM you MUST then test for
TTRAM between $1000000 and $7fffffff if
you have a 32 bits address bus !
and for that purpose bus error can be
used BUT it does not work the same
way on 000 and 030 and it works even
in another way on the 040 !

i hope this will help him !

Looks like the main problem is what Anthony said in another mail.
He never got any response when he started on his STOS extension
amd his intention was to make it TSL (or whatever it's called)
compatible but unfortunately it never happened. :-(

I wonder how much work it would mean to rewrite it?

Latest version is 0.71 but I can't find it... 0.6 had a bug which made
it
not to work on the AB040.

Take a look at: http://www.update.uu.se/~yomat/hencox/welcome.html

That would be a good start. Johan has only got 3.03.
Hopefully Doug will get some more time soon and maybe release it.

If I only knew how... does anyone know? I think there is something
in the cookie, but I'm not sure. Then you must know what to do with it.

Hopefully my AB040 will take care of that.

> > :-)))))))))))))))))
>
> No promises... but sometime fairly soon...

Cool. You must not try to cahge res though. You need to make it work in
the
current resolution or it wont work very well. I think BM uses the
current res,
like it does if you launch in in TC mode. You could check for the Nova
cookies.

If you like I could even mail you some Nova examples. It might even have
some
reschange stuff, but I don't realy understand how it works.

Great...yet another point you are finally seeing, If people with
these setups do not come forward to test, then you can see why we get
so upset when you cry about it,

>amd his intention was to make it TSL (or whatever it's called)
>compatible but unfortunately it never happened. :-(

He was willing to make it, I was willing to use it.. but people like
you was NOT willing to test, but are willing to moan when it has not
happened.... great you finally understand :))

 6ft and about 13 stone.. wow you must be big if I am little ?

 I don't see your point.. I have an artist who makes 16 color
pictures, what use would 256 color pictures be when you already
conceded in another post that this is not the answer ? I still would
not be able to see them in action on a Falcon would I ?

If I understand Anthony correct you are _wrong_. It was not _our_ fault
but _yours_, the STOS _users_. He wanted _input_ on his _extension_, not
people to test it (okey maybe he needed that as well but he would still
be able to test it best him self).

> >amd his intention was to make it TSL (or whatever it's called)

If I understod Anthony correct (see above) it's actually _we_ who should
laugh our asses off over _you_ ,you sad old soob! :-))))))

Correct me if I'm wrong but I think this is what Anthony said and this
is
realy funny if it was.
HAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAHAAHAHHHAHAHAHHHAHAHAHAH!

Eat that!

Shit, I have still not figured out how to get back old artciles in
Netscape...
I realy should go back using Emacs even though it didn't work very well
from

time to time!

So you are saying that you have no need for another graphics artist?
This was something new, so you can't make 16 colour graphics with a
Falcon nowdays. Cool. Also, I guess you have never heard of dithering
before. Oh, right this is STOS we are talking about, not any fancy
programming language like C or assembler where you do this all the time
to make them resolutions independent but tgen we have the extension
problem. A tricky one.

Also, why not make the Falcon extension works under GEMULATOR
running in 256 colours? There is always a way to do it if you
realy want. But now I forgot my self again... it's STOS we are

talking about, so it can't be done!

No, he is definitely right. The 68000 *can't* restart an instruction that
failed due to a buserror. You can skip it and jump elsewhere, but you can't
do a restart of the failing instruction, as on 680x0 with x>2 (read the
68030 programmers manual on buserror stackframes, esp. the part about the
rerun bit or what it was called).

 You realy are thick arn't you ?....have a think about it Magnus, the
penny will drop soon.. then you are going to feel such a fool...:)

 Here is a hint... he wasn't looking for input from me with my STe was
he? or from a friend of mine with a FM..... yes? no? want me to draw
some pictures to help you understand ?

>laugh our asses off over _you_ ,you sad old soob! :-))))))

 hmmm old ?

 Nope.. I don't understand what you are talking about.....do you?

>Also, why not make the Falcon extension works under GEMULATOR

 Gemulator does not support Falcon ?.. the one I have doesn't

>running in 256 colours? There is always a way to do it if you

>realy want. But now I forgot my self again... it's STOS we are
>talking about, so it can't be done!

 eh? STOS works under Gemulator...it is gemulator that does not
emulate a Falcon.. how is that STOS fault ?

Yes, sadly this is the case. Mainly 'cause the authors of said
extensions didn't have mono monitors, and didn't see the need...

> with the same features in ST high (profided he has got the
> right graphics) is not possible (he has ST HIGH with Pacifist

PaCifiST has an annoying bug in the keyboard routines, which
makes it difficult to use for typing up code (key-repeat goes mad
every now and then - particularly the delete key). However, yes,
you are right - this is not the only reason Tony doesn't code for
Hi.

Yea, that'd work... but there isn't much chance of it working on a 1040st...
(as was the point)

ST-High is a standard ST resolution, and is supported by STOS (although
admittedly not by many STOS programs).

Well you are both wrong, sort of, although Tony is more wrong. :)

> but _yours_, the STOS _users_. He wanted _input_ on his _extension_, not
> people to test it (okey maybe he needed that as well but he would still
> be able to test it best him self).

Yes, I wanted input on the extension - whether it was wanted. However, it

would only be wanted by FALCON progammers using STOS (or who would prefer STOS to learning C/asm) - ie. Tony doesn't really count.

> > >amd his intention was to make it TSL (or whatever it's called)

Sadly, Tony, it wasnt testers that I needed, but > 3 people willing to use it.

> If I understod Anthony correct (see above) it's actually _we_ who should
> laugh our asses off over _you_ ,you sad old soob! :-))))))

Nobody should be laughing, as it just means we Falcon owners dont get a bunch more games (it wouldn't have taken much work to get several good ST games running Falcon enhanced). :-(

> Shit, I have still not figured out how to get back old artciles in
> Netscape...

Well, I dunno about local (a while since I read news with NS), but you can always go to www.dejanews.com and read their archives.

> I realy should go back using Emacs even though it didn't work very well

Emacs? Urgh! :-))

Anthony

> so,if you put RAM there,you break Atari specs !!

No I don't. Simply the fact that Atari has put ROM there does in no way constitute a specification by Atari. There is no paper by Atari that says this address reagion is reserved, therefore I'm allowed to do with it what I want. If I'd manage to construct a transparently working bank-switching scheme, I could even put RAM there *while* using TOS 2.x or TOS 3.x !

Atari has put out very few specifications on hardware, one of them being that the uppermost 64 kB in the 16 MB address space is reserved for I/O. It's only that part that I'm not allowed to touch.

> the only reserved bit is NOT $ffffxxxx
> because on the Falcon030 hardware map
> the IDE port is at $fff0xxxx !!!

Atari have violated their own specs here. Hardly anybody cares as seldomly this creates problems. But thanks for pointing out.

Pipelines are flushed whenever an exception happens. RTE does nothing more but remove a piece of information from the stack, and loads PC and SR.

Funny attempt of telling me that all my software doesn't work. It does here, and apparently does for hundreds or even thousands of other people in the world.

> also you must know that a 68000 bus

It's not that bad on the 68000, but a similar thing can happen there.

Anyway you'd need to do pretty stupid things, or have a completely corrupted system for anything like this to happen.

> so do you really think it's simple to handle ????

You're free to invent an exception handler as complicated as you think you need. I'll stick to a simple version that does just what it needs, and so far, there is no Atari that refuses to run my software. STinG uses a bus error handler in one place, and uses priviledge violation exceptions all over the place. I've seen it working well on plain STs (68000), PAKed STs (68020), TTs (68030), Medusas (68040) and Hades (68060).

> everybody knows that anyway exception
> stackframes are just not the same size

> the same way on a 000 and a 030 !!!

I said *some* info must be removed. I did not mention the exact size. And it's not that difficult to find out in the code.

> the correct answers to the guy are:

That's ridiculous.

The original article did not get to me, so I'm citing from Magnus reply :

>> Of course you are right that it can be done. Admittedly I don't have
>> anything real to back this up, only a couple of simple GEM games
>> (Asteroids and Pacman, see my WWW page) but then I'm no games programmer,

I've mentioned elsewhere a nice centipede game that is completely in
a window and still is very neat and fast. It's definitely a very good
example for an excellent game written completely with GEM. It's info
says that spreading it is definitely desired. So everybody who wants
it can mail me, I'll send the uucoded binary in the reply.

My e-mail address is in the signature, the "From:" address won't work.

>> I can't even understand why anyone could think that such a game cannot be
>> done under GEM. Could someone explain why everyone believes this? I would
>> like to understand what this is that I'm missing here, that makes it
>> perfectly possible for me, but nobody else. (Except Magnus?)

And except me. I *know* games in GEM windows are well possible.

>> Tony always mentions that he cannot write a "Falcon enhanced" game with
>> better than 16 colour graphics because he doesn't have access to a Falcon.
>> But the fact is you *don't need a Falcon* in order to write a game that
>> has better graphics. Tony's PC would be perfect for drawing the graphics
>> with. If it's done the right way, the better graphics will then work on

>> any machine that has a suitable graphics mode whether it's a Falcon or
>> not. You don't even need to test it in order to know this. (Of course it

Agreed.

Cheers Peter

I do not play games often, and correspondingly I do not know where to download them. I can get excited about interesting, well designed and programmed, GEM integrated games, and therefore I have a few lingering on my harddisk. But it must be more than two years ago that I downloaded them, and therefore have no idea where from.

The mentioned Centipede is the only good action game in a GEM window. For other sorts of games it's fairly obvious that they can work in windows, as speed is not such an important factor. Those other, non-action games I've got are Pille Palle (Tetris clone), Yukon (Solitaire clone), and a Minesweeper (MineX). There is Ballerburg 2 (two players each with a fortress, they got to shot each other, got elements of strategy games too), DTE 2 (Defend the earth, an invaders type game like the old "BOUNCE", nice, but not quite as well done as Centipede), and Magic Stone (another Tetris clone, has three variations of the main game idea).

These games are all GEM integrated, and either public domain or shareware. For some of them the language is german.

Send me an e-mail and you'll get Centipede in return.

I guess I remember it, but wasn't it rather old ? I'd had thought the autor went away from Atari ... but I don't really know. Anyway this kind of game should be fairly easy to do.

Cheers Peter

If you have any friend using a newer CAB, maybe you can do a quick test if
that one would run. CAB works well with MagiC, and since MagiC is a successor
of KAOS ...

BTW.: There is a fix for the harddisk folders problems in TOS 1.0x !

Cheers Peter

How would you switch from 1024 x 768 x 24 bit true color at 80 Hz to
320 x 200 x 16 at 50 Hz and back (!!!) via Setscreen?
Do you think that Setscreen will work with ISA/PCI graphic cards?

Have you read the atari documentations:

"It is maintained fo backward compatibility with existing ST programs only.
It should not be used for new programs. It will not keep pace with future
hardware or software improvements. The VDI should be used."

(TT030 TOS Release Notes, ATARI Corporation, october 8th 1990.)

There is no working Setscreen call on the newer machines. All you can
interrogate are VDI functions. (current resolution & color depth)

>TOS version shouldn't make a difference any more, as the TOS version
>dependent table is now generated on run-time.

So STOS applications are running under MagiC (Single Mode) and MagiC PC/Mac?

How many of these "new" STOS applications do exist?

From an german ATARI magazine (december 1997, evaluation of the reader inquiry):
[...]
Which type of monitor do you use?

DTP monitor	12.6%	
VGA monitor	50%

This ATARI magazine is sold more than 20 000 times per month.

How many _active_ ATARI users do you know worldwide in 1998?
Are >16 000 _counted_ _active_ german users without access to st low
a negligible minority?

Greetings,
  Uwe.

Newsgroups: comp.sys.atari.programmer

hi there !
some days (weeks ??) ago, someone
asked me for information about how
to use BrainStorm's DSP Jpeg Decoder...
well,i'm sorry but i had a lack of
time since, but ,anyway,here it comes !

first thing,
you must know about the structure
pointed to by the related cooky "_JPD":
(sorry i'm extracting it from ASM code,
but it's not difficult to translate to
other languages,sorry for the aspect)

```
         RSRESET
JPGDVersion   RS.L 1
JPGDOpenDriver    RS.L 1
JPGDCloseDriver   RS.L 1
JPGDGetStructSize  RS.L 1
JPGDGetImageInfo   RS.L 1
JPGDGetImageSize   RS.L 1
JPGDDecodeImage    RS.L 1
```

as you can see,the first long is a
version number (usually 1.0x), and
the following are pointers to the
functions that perform the decoding
of the jpeg file....

(in the following,a6 points to the above
structure...)

first call, you MUST inquire about
the size of local memory structures
required for decoding process,
with something like:

```
         jsr  ([a6,JPGDGetStructSize])
```

you get in D0 register the size required
(it's recommended to Malloc it right now...)

here is the structure of the local stuff:

```
         RSRESET
JPGDInPointer RS.L 1 * JPEG Image Pointer
JPGDOutPointer     RS.L 1 * Output Buffer
JPGDInSize    RS.L 1 * JPEG Image Size (Bytes)
JPGDOutSize   RS.L 1 * Output Image Size (Bytes)
JPGDInComponents   RS.W 1 * JPEG Image Components Number (1->4)
JPGDOutComponents  RS.W 1 * Output Components Number (1->4)
JPGDOutPixelSize   RS.W 1 * Output Pixel Size (1->4)
JPGDOutFlag   RS.W 1 * 0 (RAM Output) / -1 (Disk Output)
JPGDXLoopCounter   RS.W 1 * Number of MCUs per Row
JPGDYLoopCounter   RS.W 1 * Number of MCUs per Column
JPGDUser1     RS.L 4 * Pointer to User Routine / NULL
JPGDComp1GammaPtr  RS.L 1 * Component 1 Gamma Table / NULL
JPGDComp2GammaPtr  RS.L 1 * Component 2 Gamma Table / NULL
JPGDComp3GammaPtr  RS.L 1 * Component 3 Gamma Table / NULL
JPGDComp4GammaPtr  RS.L 1 * Component 4 Gamma Table / NULL
JPGDUser2     RS.L 1 * Called during Decompression / NULL
JPGDOutTmpPointer  RS.L 1 * Current OutPointer
                * Temporary Disk Buffer Pointer
JPGDMCUsCounter    RS.W 1 * Number of MCUs not Decoded
JPGDOutTmpHeight   RS.W 1 * Number of Lines in OutTmpPointer
JPGDUser3     RS.L 2 * Free, Available for User
JPGDOutHandle RS.W 1 * 0 / Output File Handle (see OutFlag)
JPGDMFDB      RS.W 8 * Output Image MFDB
```

then,you can really begin and open
the driver itself , remember you
must always give the address of the
structure you've just 'Malloced' above
as a parameter in A0 register.

```
         jsr  ([a6,JPGDOpenDriver])
```

then,the easiest way is to load the
whole jpeg file (they're usually small)
when this is done,you must give a pointer

on the memory containing the file in the
decoder's local structure (JPGDInPointer)
,also give the size (JPGDInSize).
then call:

```
         jsr  ([a6,JPGDGetImageInfo])
```

you can then read some parameters
about the picture, width, height,
and so... which are stored in the
MFDB structure (JPGDMFDB)

you must then choose the output parameters
for the decoder.usually:
JPGDOutComponents=3 (i.e. r+v+b)
JPGDOutPixelSize=2 or 3
this last one depends whether you want
to output directly in 24 bits (=3) or in
Falcon 16 bits truecolor (=2), etc...
warning:in the truecolor local MFDB ,i remember
that the 'wordw' parameter was usually
wrong,so you'd better not copy it
directly, just put (width+15)/16 as usual...

here,you can call:

```
         jsr  ([a6,JPGDGetImageSize])
```

if you want to know the size of the output
picture (according to your previous output
settings)

here,you're nearly done:

```
         jsr  ([a6,JPGDDecodeImage])

         jsr  ([a6,JPGDCloseDriver])
```

and,then display the bitmap !!!

that's how i use it in CentView® with
direct falcon truecolor output and
it works fine...

hope this will help many
of you using this fine decoder...

n'cha

All the stuff you snipped was. It's there to support the pseudocode above. Tell me how to call "appl_init", "appl_find", "appl_write" and "evnt_multi" (evnt_mesag would be simpler here though) in GFA basic and I'll come up with a reasonable approximation! <G>

>Oh dear, what is the world comming to?

Perhaps the real error was in mixing pointers and arrays? Rather than taking "cp = (Cookie*)$5A0" literally it is better to visualise it as "cp = (Cookie[])$5A0" which is its documented meaning. Thus, imo,

cp[-1].item would be preferable to (&cp[-1])->item or (cp-1)->item.

As to the Lattice peculiarity, I'm not an expert on this but I see nothing wrong with Lattice flagging an error. "cp[-1]" does indeed point to 1 element prior to cp - but a *whole* Cookie element. Lattice was being asked to stack both members of cp[-1] (not a pointer to them) then try and dereference them as a pointer in order to gain access to the members it had just stacked! Confused? I am!

I recall the comments were C++ ones. Was this simply to save typing or was it a C++ compiler. I believe that there are differences between C and C++ in this area?

:-)

XEmacs is actually pretty cool. If we would have had something like this
for
the Atari it would be great.

Oppssss... that is not nice.

> This is a clean "rainbow" tos 4Mb ste in low rez.

I have never tried it on something like that. Maybe the XBIOS calls used
for sound isn't the same on the STe? I don't remember what I do at
startup anyway. :-)

Yup. :-(((
If I quit work I may get some time to do what I want, but then I wont
have much money to do anything.

I have this as well. It's quite nice, but you get bored of it after a
while.
It's also only a mono game (mono graphics), so it doesn't look very
exciting.
It does however work. :-)

There is that breakout clone by Atari which is quite funny, but of some
reason
is the sprite is corrupted under MagiC. A new breakcout clone would be
nice as
well. Hmmm... that can't be to hard....

The same here.

Okey. I have got a bunch of Tetris clones and one which has a few
different
types of Tetris themes in the same game, like Coltris which my
girlfriend loves
(she has got the highscore on that one as well...). Maybe it's Magic
Stone.

For Mines I have got Ataris own version which is pretty good.

The others doesn't sounds to exciting.

> These games are all GEM integrated, and either public domain or shareware. For

Doesn't realy matter in which language they are as they are quite easy
to
understand.

Hmm... I don't think it's _that_ old, I do think the programmer doesn't
do
much for Atari these days though.

Here are a few games I would like to see and they all would be very easy
to make.

- Pong. Why havn't anyone made this one???

- Breakout. Atari did a version but it doesn't like MagiC at all.

- A PinBall game! Another game which should be possible to make and they
are
  realy fun to play. Even some fancy graphics should be possible in 256
colour
  modes on a gfx card. The same goes for the above.

Anyone wanting to try?

Hey! perot@suse.modem.stud.uni-hannover.de (Peter Rottengatter) wasn't
it Tue, 24 Feb 1998 09:09:04 GMT that you wrote:

>>> has better graphics. Tony's PC would be perfect for drawing the graphics
>>> with. If it's done the right way, the better graphics will then work on
>>> any machine that has a suitable graphics mode whether it's a Falcon or
>>> not. You don't even need to test it in order to know this. (Of course it
>
>Agreed.

I thought you might agree :(, so you are advocating that all I need
to do to make a Falcon enhanced game is get some 256 color artwork ?,
thats what you just agreed to...and you agree that I should make a
falcon ENHANCED..not just compatible ..game on a STe and release it
without testing,

Both statements are wrong, everyone else agrees they are wrong.. even
the original poster has seen the error of posting that all it needs is
better gfx... yet you agree..
..

>Oppssss... that is not nice.

 Especialy when YOU say this is how it should be done..

 ever hear the expression EGG ON YER FACE!!!!
>
>> This is a clean "rainbow" tos 4Mb ste in low rez.
>
>I have never tried it on something like that. Maybe the XBIOS calls used
>for sound isn't the same on the STe? I don't remember what I do at
>startup anyway. :-)

 So the games I make will work on ST,STF,STFM,STe MEGA, MEGASTe,
Falcons and TT, with no fixing.. no problems yet you moan that it wont
work on Nova ? and say I should program it properly?, and you say this
is the way it should be done?... hahahahaha won't even work on a STe

 You and Peter both know so much... yet you are both all talk, you can
prove nothing....

 I PROVE MY CLAIMS as they are there to download,

 Magnus proves it with a game that does not work on a STe?
 Peter Rottengatter proves it with a centerpede clone ???

 hahahahahahah... come on guys, this is below you.. time to STOP
talking and start proving what you say.. you are both TALK TALK TALK,
lets see you prove it... I can prove my claims, lets see you prove
yours.. or concede defeat and admit you are both talking through your
bottoms :))))))

hahahaha show me a fast action arcade style 8 way scrolling, stereo sound, animated backdrop, 100 individual sprites, blah blah like I make, show me one working in a GEM window or start apologising for talking crap!

No excuses, it is you two who come into this newsgroup preaching to a game maker and telling him how it should be done.. yeagh well prove it, because I say you are both talking bollocks and thats all it is talk a.....PROVE IT! just show me such a game...you can't can you ?... I wonder why,

You should both maybe THINK before speaking...If you can not back up what you say, then why say it?

This is an open public challenge for you to prove what you are saying.. I have proved what I say... now its your turn, and no lame excuses...you found the time to come into this group and publicly try to tell me how to make games.. so find the time to back it up...

Maybe I should fix it then? This one is _realy_ easy to fix. Would
take me 5 minutes if I did it.

> >This is a clean "rainbow" tos 4Mb ste in low rez.
>
> hahahaha NEXT!

Arrghh..... I guess I have to test it on a STe before I release any new
version, or atleast check which machine it's running on as I don't do
that
now. :-)

> So the games I make will work on ST,STF,STFM,STe MEGA, MEGASTe,
> Falcons and TT, with no fixing..

No fixing? On your webpage there are special version for TT/Falcon,
atleast
for Diamond Edge.

> no problems yet you moan that it wont
> work on Nova ? and say I should program it properly?, and you say this
> is the way it should be done?... hahahahaha won't even work on a STe

This is a bug an I'm sorry about it. I will fix it, don't worry.

> You and Peter both know so much... yet you are both all talk, you can
> prove nothing....

Because of a silly bug? Get serious. It's also my very first try top
make

something resambling a game. I have not said that it's very good either,
it was just an atempt to make something for my self.

> I PROVE MY CLAIMS as they are there to download,
>
> Magnus proves it with a game that does not work on a STe?
> Peter Rottengatter proves it with a centerpede clone ???

:-)

> You should both maybe THINK before speaking...If you can not back up
> what you say, then why say it?

Just because you are such a lovely person I will fix the bug (because it
is
a BUG) and upload it. Then you can say whatever you want.

These kind of trouble is not always due to the STOS, the GFA, or the
programer itself !
I know many people that have been disapointed to see that 80% of
games/demoes crash on the falcon (including 100% ,68000 or C, written code)
because they were using MadMax musics.
and half of the menu-disk I try were playing musics,
and 90% of theses musics was made by Mad Max.
and so 100% of theses crashed.

Not because of using STOS language.

Everybody happy ?

I snipped your comments and refuse to discuss them because you admit
at the end that you never tried my software (so how can you comment)
and you don't have a standard atari setup capable of atari low rez

I don't understand how you even attempt to join in this thread when
you haven't even got a normal ATARI...how can I talk to you about low
rez software when you don't own a low rez setup..

I look forward to a conversation with you when we talk about other
resolutions you are capable of achieving ok :)

>because they were using MadMax musics.

Yes I know about this... and all my software detects Falcon.. and
plays samples instead....even diskmags detect falcon and refuse to
play music or give music options,

Also a lot of software was packed with the very nice Atomic.. I used
it a lot in then past, then we discovered this fell down on the Falcon
so stopped using it,

Special compilers are made to help us with better Falcon and TT and
future os compatibility

new Ways of programming are effected and sometimes stfm has to suffer
to accommodate these, all to help falcon and TT owners

A lot of effort goes into making software Falcon compatible and TT
compatible, this is not easy when all some of us own is an STe,

This is why it is then insulting for people to come along and complain
that they can't run it because they disabled functions on there
machines...

Instead of complaining and crying like a baby that they haven't got
low rez...why not offer feedback advice and encouragement to those of
us who are trying to support YOUR machines with our lesser ones.. stop
moaning and start helping is what I say :)

And yes..I am very happy :)

I do not own a Falcon , My computer is an STe with standard STe
resolutions, but I do spend many many hours and a lot of effort trying
to support your machines.. yet you and Peter come along and instead of
helping people support you, you insult us instead,

I have asked in these forums many times for people with Falcons and
TT's who have enhanced them to come forward and test the software, you

all sit there and do NOT offer this help, then when I make software
you tell me you will trash it, or you make stupid childish and
insulting comments, ** Please think about this paragraph :(**

]-Cheers Peter

Hi Peter! Just a couple of things I wanted to ask...I'm using the latest versions of STing -except- for the modules. When I add the new modules I get a 2-bomb bus error. Replace the older modules and everything works fine...any ideas?

Also, I got STing to work with MultiTos using AES v4.0 (with STing loaded after MINTNP.PRG, like you said), however I've been unable to get STing to work with MultiTos using AES 4.1...it looks like its working, even to the point of reporting "success" in the dialer window, but none of my Internet apps will work...Any ideas there? (other than scrapping M-TOS!) <grin>

Thanks in advance...! ;-)

Hi

A couple of weeks ago I posted asking on the availability of the GFABAsic 3.5e compiler, and someone replied in a post giving a contact for uh, someone or other to do with a SHAG(?!?!) meeting. Can anyone repost this information, or mail it to me?

Thanks

Jim

STOS can cope with ST-Hi as well, although I dont think Tony's diskzines can.
His games dont, obviously. Admittedly people with Hades/Medusa are
still stuffed,
but IMO they aren't a big issue.

> BTW Have you ever considered that for many many people, whose machines really
> do have ST-Low, it's a real hassle to switch to ST-Low ? I still have a 1040

Assuming you have a monitor capable of it, STOS will change into it (including
from Falcon resolutions) and restore the screen nicely on exit. Not sure about
TT, as I have no info on this.

> machine with ST-Low, but I'd need to carry it around and probably find a TV
> set to connect it to, because I (and never of my local friends) do not have

STOS != ST-Low only. STOS itself gets on fine with ST-Hi, and with the aid
of my extension handles many other resolutions.

Anthony

> 16-bit high
> res? Cool.

No, but unless the nova disables the rest of the Falcons video system
(possible) then it'll just switch to ST low, and on exit it will restore
the system to the mode it was in before starting (although there is
a bug in the current release that has problems with extended resolutions
as provided by BlowUP etc. and NVDI).

If someone wrote a diskzine shell for 16-bit mode it would work though
- I have written a prog (in STOS of course) which works nicely in
640x480x16bit on my machine. I haven't put in the intel byte ordering
stuff for NOVA though...

> I still have to find a GEM shell which doesn't and have to launch a
> program in a certain resolution sounds like stone age to me.

Yea, but this isn't the case. On the Falcon, STOS 2.07 beta1 and above
(- the next release will be beta 4, if I ever fix this damn bug) handles
Falcon video modes correctly. NOVA, well who knows? Magnus, if you mail me
I'll get you to run a few tests...

TT, well, it just uses the standard ST setscreen(...,0) call to change mode
and restores the mode it was in before via setscreen. I dont know of a
TT setvideo() equivalent, so no code for it.

> ;-)

Wind up merchants, the lot of ya. :-)

After a 2 month hiatus, I'm working on my serial driver again.

It seems to have a problem with things like Zmodem. I was wondering
it these sorts of programs mess around with the IOREC directly
instead of going through the BIOS vectors, and if so what sort of
behaviors do I need to emulate in order to be compatible?

Newsgroups: comp.sys.atari.programmer

The code I posted to the newsgroup was written while online, and had a
couple of errors, one of which was the line you pointed out. The other
was where the cookie pointer gets assigned a value.

```
     Cookie *cp = 0x5a0
```

should have been

```
     Cookie *cp = *(Cookie *)0x5a0;
```

The former assigns the value 5a0 to cp, the latter assigns the value in 5a0 to cp. (which is what it should have done)

The other error seems to be a Lattice peculiarity. "cp[-1]" should point to one element prior to cp, but lattice parses this as incorrect.

To fix this, I've just changed it to "(&cp[-1])"

Here is a complete, tested (on my TT) sample app to show the correct code and use of the routine.

Written in Lattice C 5.60

(If you have 5.06, you'll need to write your own cookie.h funcs like getcookie, putcookie etc, as they didn't arrive until 5.50 or so)

(I used "int = 32 bit, near code, near data, 030 code, allow multi-char constants, disable stack checks", but this should compile OK for a 68000 STE)

```
#include <cookie.h>    // for putcookie() def
#include <string.h>    // for memmove() def
#include <osbind.h>    // for Super() def

#include "0/types.h"   // for definition of uint32

#define TEST_COOKIE    'X24A'

typedef struct  {
     uint32 item;
     uint32 value;
} Cookie;

void deletecookie( uint32 cookie )
{
  register Cookie *cp;  // pointer to cookies
  void *sp = NULL;  // saved stack pointer

  if( !Super( (void *)1L ) )  // are we in supervisor mode?
    sp = Super( NULL );  // no, so change to it

  cp = *(Cookie **) 0x5a0;  // get pointer to cookie jar
  if( cp )  {   // if jar exists
    // while{...} is essentially a getcookie
```

```
    while( cp -> item )  {  // are we at end of list?
      if( cp -> item == cookie )  // is this the cookie we want to delete?
        break;     // yep, so break out of loop
      cp++;   // increment pointer
    }
    if( cp -> item )  {  // is this a null cookie?
      do {  // overwrite this cookie with next in list
        // (cp + 1) points to next cookie   ie addr + 8
        memmove( cp, cp + 1, sizeof( Cookie ) );
        cp++; // increment pointer
      } while( (&cp[-1]) -> item );  // loop until null cookie copied
    }
  }

  if( sp )    // if we switched stacks
    Super( sp );   // restore old stack
}

void main( void )
{
     putcookie( TEST_COOKIE, 32 );    // put a bogus cookie in jar

     deletecookie( TEST_COOKIE );     // now remoce it
}
```

One could argue here, which program crashes. Would you call the toppling tower a badly designed one, if the only reason it topples is that stupid people dig away the soil beneath it ? Here you go. The tower is STinG, the soil is STinG's priviledge violation handler, and the stupid people is MiNT, which recklessly unlinks STinG's priviledge violation handler.

This is a MiNT bug.

Cheers Peter

Greetings Gaven,

yep, it works great! :-)

> The code I posted to the newsgroup was written while online, and had a
> couple of errors,
I'll forgive you this time. ;-) That's not bad going considering it was off the top of your head.

> The other error seems to be a Lattice peculiarity. "cp[-1]" should point
> to one element prior to cp, but lattice parses this as incorrect.

> To fix this, I've just changed it to "(&cp[-1])"
I'd never have worked that one out!

Anyway, thanks again.
Cheers, Karl.

Sorry, but I don't even have access to ST-Low these days. I'm to lazy to
crawl down on the floor and change monitor output and fiddle in complete
darkness before I can get a picture at all. As long as games doesn't
work
with gfx cards it must be a hell of a good game before I even consider
to change.

Also, having a Falcon it's realy sad to try st games as you want more
than 16
colours, so I usually doesn't bother. If they had had TC or atleast 256
colours
I would test them, but now I just hate it. This is me but I guess many
others
can stand with 16 colour STOS games so I let them test them, if those
people
excist. Actually I think most Falcon owners thinks like me. Atleast 256
colours
or it's not worth it. Maybe we are narrow minded, but who cares? We want
good
looking colour full games for our Falcons.

I know. I wasn't reaky serious when I wrote the above. I knew how Tony
would
react. :-)

> If someone wrote a diskzine shell for 16-bit mode it would work though

Yes that is a pain in the arse, the intel byte order. :-((((
Also, you can make STOS games with more colours on a Falcon but as far
as
I know there are none. If Tony could make "real" Falcon versions of his
games
with enhanced graphics it would be very nice indeed. Just making Falcon
compatible
games isn't enough.

> > I still have to find a GEM shell which doesn't and have to launch a

Would it be possible to make STOS games work on the Nova? I think NOVA
VDI
supports resolution changes on the fly, but I have no looked into it
yet.

If you used VDI it would be no problem. You could even make them run in
a GEM
window. ;-)

Totally agree, Beside they really are stupid tryng to run sting under
mint when they can run mintnet!!.
If I was running sting, might as well get magic too.
Same concept as: buying a mac to run winsoft 95. If you run only run
win95 emulated, might as well get a pc!.
Same idea, same stupid things.

But this is my whole point !, how do you know if it is a hell of a good game or not if you are not going to try it ?
Games that recieve 90 and 95% in recent ATARI Computing magazine, are they not good enough... what do they have to recieve before you think its good enough to try ? please do tell ?

>Also, having a Falcon it's realy sad to try st games as you want more
>than 16 colours, so I usually doesn't bother.

I agree, If I had a Falcon I would want 256 color games, I understand this.. but the concencus of opinion seemed to be that good quality 16 colour games are better than no games at all...

>can stand with 16 colour STOS games so I let them test them, if those
>people excist. Actually I think most Falcon owners thinks like me. Atleast 256
>colours

H.E.R.O.2 and the recently Falcon and TT patched Diamond Ice, feel free to ask your fellow falcon owners to tell you how crap this game is on there Falcon..

>or it's not worth it. Maybe we are narrow minded, but who cares? We want

"we" just exactly who are you spoksman for now ?."we" ?

So you are the spoksman for the Falcon owning community are you.. My apologies I had not realised I was speaking with someone so important:)

So it is the WHOLE falcon community as in "we" that say my software should be trashed before using... tsk sorry... I thought that was your opinion... now I see you say its everyone with a Falcon.. you all think my software should be trashed....well thats told me hasn't it....

>good looking colour full games for our Falcons.

I agree with this.. I do not blame you one bit... I would feel exactly the same.. But that is no reason not to have quality 16 colour games as well,

Perhaps i should withdraw falcon software and stop supporting the falcon.. and when people ask me why..i will tell them to speak to there spokesman.....

No, but does they work on a Nova card? No.

> Games that recieve 90 and 95% in recent ATARI Computing magazine, are
> they not good enough... what do they have to recieve before you think
> its good enough to try ? please do tell ?

Well, I have not tried them as they just don't work (Nova you know).

> colour games are better than no games at all...

Ofcourse, but are they that good? Maybe they are. And get 90% rating in
Atari Computing can't be very hard when you see what you have to compare
with. I'm not saying that your games are crap, just that the Atari

gaming industry, which doesn't even excist, is crap.

I would like to try CoC, but there is no demo of it to try first.

If someone could make all old ST-games work on my Falcon running from HD
and in any res I would by more than thankfull.

> >can stand with 16 colour STOS games so I let them test them, if those

Did I say that they were crap? Shit, I don't hear what I'm saying
anymore. ;-)

> >or it's not worth it. Maybe we are narrow minded, but who cares? We want
>
> "we" just exactly who are you spoksman for now ?."we" ?

Sorry I ment to say "I am". I don't know why I wrote "we"... but maybe I
was right? Scray thought. :-)

> So you are the spoksman for the Falcon owning community are you.. My
> apologies I had not realised I was speaking with someone so
> important:)

Hehehee... sure if you say so. Ask me first! :-)

> So it is the WHOLE falcon community as in "we" that say my software

I still don't understand where I wrote that your games were trash?
Where?

> >good looking colour full games for our Falcons.
>
> I agree with this.. I do not blame you one bit... I would feel
> exactly the same.. But that is no reason not to have quality 16 colour
> games as well,

Well, how hard would it be to add better graphics to the Falcon
versions?
You do have a PC don't you? Or can it only display 16 colours as well?

> Perhaps i should withdraw falcon software and stop supporting the
> falcon.. and when people ask me why..i will tell them to speak to
> there spokesman.....

Funny guy. Now you finaly got someone to blame when you stop making
games
or atleast Falcon compatible games.

Can't Anthony make some cool extension to let you use the same code
for both version without any patching and at the same time support
more colourfull graphics?

 Wouldn't it be nice if people like you came forward and helped us
find out if it was possible.. rather than just moan ? If you people
with these things are not prepared to test software then how do we
achieve this ?

>Ofcourse, but are they that good? Maybe they are. And get 90% rating in
>Atari Computing can't be very hard when you see what you have to compare

 hmm, Well 5 years ago when lots of people where making games, I was
getting 80-90 scores.....

 But I do see what you mean.. I am obviously biased for my games :),

>> H.E.R.O.2 and the recently Falcon and TT patched Diamond Ice, feel
>> free to ask your fellow falcon owners to tell you how crap this game
>> is on there Falcon..
>
>Did I say that they were crap? Shit, I don't hear what I'm saying

 Sorry.....But in my house you put all the rubish in the trash can...
this is where you told everyone in a public newsgroup where you would
put my software "in the trash", this is what got me to respond in this
way, it was not exactly supportive was it :(
>
>> >or it's not worth it. Maybe we are narrow minded, but who cares? We want
>>
>> "we" just exactly who are you spoksman for now ?."we" ?
>
>Sorry I ment to say "I am". I don't know why I wrote "we"... but maybe I
>was right? Scray thought. :-)

 hehe, I just picked up on the we...glad I didn't say it :)

>I still don't understand where I wrote that your games were trash?
>Where?

 You said you would throw them in the trash... Normal people don't
throw good stuff in the trash do they ?

>Well, how hard would it be to add better graphics to the Falcon
>versions?

 For me very hard.....but for a Falcon owner it would be easy..

You could let me borrow your Falcon for 6 months and I will return it
with a kick arse game <smile>

>You do have a PC don't you? Or can it only display 16 colours as well?

Eeerm what would that have to do with it?, I have had a PC in one
form or another for around 4 or maybe 5 yrs... it has nothing to do
with making games falcon enhanced?

If I am not mistaking all those problems with disk magazines
were solved ages ago by Richard Karsmakers and his ST NEWS
team. They were using a Gem Shell for their great magazine.
I don't know about the Gfa compiler they used but if the
compiler produced TT and Falcon compatible code, the old
issues will still work on high color and high res machines.

I am sometimes wondering why I have to swich to ST low (or
medium) just to read some more or less interesting articles.
They are equally well (even better) read on overscanned ST
high. A good axample is the ATOS magazine, they are
publishing their magazine in ST Guide format. So graphics
and links are possible. And as ST guide is a well designed
GEM program there are no problems with resolutions and
graphics cards.

Only problem with ATOS is that it is German, so the whole
englisch community doesn't know about it.

Wow, that was some time ago... Phew, what was it called? Mod player
the luxe or something like that? Did you ever see it's successor,
with nice Gem shell and functions to play Mad Max and Count Zero
.mus files?

You just can get the complete Users Manual from Motorola just
by asking them for document number MC56002UM/AD

I just did so, and got it the next week free of charge...

> Yes that is a pain in the arse, the intel byte order. :-((((

Yup...

> Also, you can make STOS games with more colours on a Falcon but as far
> as I know there are none.

I know of 2, but I dont know if they have been released. I also know of
another two aborted games (left the Atari scene).

> If Tony could make "real" Falcon versions of his
> games with enhanced graphics it would be very nice indeed.

It would, but it'll only happen if someone GIVES tony a Falcon. :-)

> Just making Falcon
> compatible games isn't enough.

Its better than nothing, but I agree - I really dont play many ST games...

> > Falcon video modes correctly. NOVA, well who knows? Magnus, if you mail me
> > I'll get you to run a few tests...
>
> Would it be possible to make STOS games work on the Nova? I think NOVA

Maybe, maybe not. IIRC, BM has code to write directly to the screen, so it
is definately possible. Adding it to my existing 16-bit mode routines wouldn't
be too hard. Actually, I have been thinking about releasing the source code
to my extension, so if anyone wants to try this, mail me...

> VDI supports resolution changes on the fly, but I have no looked into it
> yet.

Well STOS doesn't get on too well with the VDI...

> If you used VDI it would be no problem. You could even make them run in
> a GEM window. ;-)

Yea, well GEMMA source is available as well - anyone wanting to patch the
compiler so that we can compile AES/VDI stuff is welcome to try. :)

That was actually planned - I even started (called "Falcon Missing Link"
- on my WWW pages) but I dont have the time, or the enthusiasm (only about
3 people wanted it) to do it.

Hehehe... actually, I seem to remember telling you about this one... :-)

You can find a implementation of BubbleGEM for GFA in the FAQ-site for
Face Value. Have a look at the UTIL-section at:

http://www.geocities.com/ResearchTriangle/4558/starteng.htm

It is spesific to the Face Value engine (http://home.sn.no/~veg/), but
you should have no problem adapting it to your own program if you do not
use FV. And remember to send Manfred Ssykor a note of thanks (he wrote
the BubbleGEM routines)...

>> - I have written a prog (in STOS of course) which works nicely in

>If I am not mistaking all those problems with disk magazines
>were solved ages ago by Richard Karsmakers and his ST NEWS

 haha,, hardly.. as the last issue of ST NEWS I saw.. you could not
run it on a ST unless it had a Hard Drive, Thus someone like me who
loves diskzines never got to read it :(, whats the point of making a
diskmagazine work in all resolutions.. then not letting people read it
unless they have a hard drive... utterly stupid.... you will now tell
me the same old story how everyone has a HD and I will say not the uk
OFF line community and blah blah blah.....

but whats the difference between me forcing a resolution.. and st news
forcing a HD ?

>high. A good axample is the ATOS magazine, they are
>publishing their magazine in ST Guide format. So graphics

 I would have thought a better example would be in HTML, I have always
advocated that this is the best thing for a diskmag... I made shells
for people who asked for them for there own diskmags... but personaly
I would prefer html any day... even off line readers would benefit and
who cares what machine and what resolution..

Right, so you know how to do it right. Make it work in
all resolutions and from all posible drives.

> but whats the difference between me forcing a resolution.. and st news
> forcing a HD ?

You know evrybody has.... :-)

> >high. A good axample is the ATOS magazine, they are

Better not. The last time I tries CAB (before it went comercial),
it wouldn't work on my machine (unless I switched to an other TOS
version, but don't like that). I think that ST Guide is more
common then HTML browsers are. But there is no reason to publish
it both in HTML and ST Guide format (I think there is a utility
to convert them into each other).

Bye, Hans

I don't understand your question or reasoning here ?... I stated it
was stupid to make it work in all resolutions but force it to need a
hard drive... my point is obvious... yours is somewhat confusing and I
don't understand the question or why you are asking it.. I made no
claims as to what i can do.. or are you just trying to be sarcastic ??

>> but whats the difference between me forcing a resolution.. and st news
>> forcing a HD ?

So HTML is also not good for your ATARI,, lets see... atari low res
is no good, and you machine doesnt like html... you sure its a bloody
atari ?

>version, but don't like that). I think that ST Guide is more

>common then HTML browsers are. But there is no reason to publish
>it both in HTML and ST Guide format (I think there is a utility

html can also be read on other machines that might be interested in
the content... surely you knew I would say that ? :)

eeerm thats all other machines accept yours it would seem ? BTW CAB
is not the only HTML reader.....

paxton@zetnet.co.uk (Tony Greenwood) writes:

> I snipped your comments and refuse to discuss them because you admit
> at the end that you never tried my software (so how can you comment)

> and you don't have a standard atari setup capable of atari low rez

You said yourself that you need standard resolutions for your software to work with. My main machine (a hacked 520 ST+) does not support any standard resolutions. You said yourself that one would need ST-Low in order to run all STOS derived software.

If the programmer himself says his product won't run on my machine, I won't go through the hassle of trying it. The programmer should know. Or are you saying you don't ?

> I don't understand how you even attempt to join in this thread when
> you haven't even got a normal ATARI...

Aha. One definitely needs a normal (whatever that is) Atari in order to join a thread, the subject line of which reads "C Compiler". What a piece of bullshit.

So finding out that some machines won't run your software under no circumstances, you simply divide the Atari world into two classes of machines : One will run your software when set up properly, the other doesn't. Fair enough, so far. Then you label the former "normal Ataris", and the latter "non-normal". That's a bit lame isn't it ? Furthermore you deny people with "non-normal" machines the right to discuss these matters ? That's more than lame, that's rather a silly excuse (saying "Sorry, I can't do any better") than any sensible statement.

I'm ready to discuss any drawback of C people will come up with for discussion in a sensible way; you however jump into people's face if they dare to mention anything even faintly negative about STOS.

> how can I talk to you about low
> rez software when you don't own a low rez setup..

I've seen it, I played games using it (MidiMaze rules !), I know how it works in terms of both hardware and software. I see no reason why you should have problems talking to me about low rez software. This is of course meant in a sensible way, I do not accept dogmatic statements.

I just do not have any permanent ST-Low setup, because I find one cannot really work with it. Still I make sure that my software will run perfectly in ST-Low.

> I look forward to a conversation with you when we talk about other
> resolutions you are capable of achieving ok :)

I doubt that that will ever happen, because resolution dependent software is not state of the art anymore. Too many people have machines with too many different screen resolutions. I take care to make my software work

with your screen setup, while you refuse to even think about making your software deal with 960x544 and 1024x864. I still have a machine with ST-High, but as far as I've been told, STOS software won't even run on that one (and that's a standard resolution, that's for sure).

Cheers Peter

Aha. I didn't know that, some other people's statements sounded just completely different.

So are there any interesting pieces of software in STOS that were written with ST-High in mind (or even better resolutions still) ? I'd like to give it a try.

Cheers Peter

I'll never understand why diskzines need their own, proprietary, non-GEM shell, so that you surely can't do anything else in the background. I like the Atari Times for being HTML, I can read it using CAB and still have an IRC conversation going on in the background for instance.

Good, but there is more to modern computing environments than resolution independence. I agree with Magnus, and would say that software that seizes the entire system is, if not stone age, then bronze age.

It's not a Lattice peculiarity, it's standard behaviour. After all, cp[0]
gives you the zeroth element, and not a pointer to it. Why do you expect
it to return a pointer to the element before the zeroth, if you write cp[-1] ?

No, not at all. Where precisely does it happen ? Replace one module after
the other, so that you find out which module gives you the problem.

>   Also, I got STing to work with MultiTos using AES v4.0 (with STing loaded

>   apps will work...Any ideas there? (other than scrapping M-TOS!) <grin>

No. I don't know in which ways MTOS modifies the system. Maybe it's
messing with interrupts, unlinking STinG's main handler ? Does a ping
to 127.0.0.1 work, with STinG switched on in the "STinG Internals" ?
Does the Dialer get beyond the success, i.e. to the point where the
dialing window closes again ?

> You just need the right harware to display them on. ;-)

Choose :

  * A 12 MHz 520 ST+ with SM 124 (resolution 960x544 monochrome) using
    CAB.

  * A Pentium 133 (64 MB) with Matrox Millennium (1280 x 1024 TrueColor)
    on an Eizo F56, using Netscape on Linux.

Which one is the right hardware ? With both it gave me white pages.

> Maybe not in the respect as you said above, but from a design point of view they

Hmm. Indeed I find it more important that the pages are readable, than that
they show a great design. Certainly I'd call unreadable pages a bad design
anyway. Sorry for my pages then, as most likely you'll say that they have
no design either.

Cheers Peter

Good question. But in the case with Novas I don't think it's going to be
very easy, unfortunately, as it hsa got a completely different screen
layout. If STOS would use some kind of graphics library which it
used for all screen outputs (like Apex 3 have there you just replace
the screen driver with either a Videl or Nova driver) it would be an
easy
task to write any game for any graphics type/card whatever. But I guess
that
will not happen as it would probbably mean rewriting STOS. While we are
on
it, why not rewrite STOS? Anthiny has made so many patches to it so it's
basicly already is a new program.

You did? Cool, but 5 years ago wasn't exactly very busy games wise
either.
Talk about 87-92 when you could read about 20 new game reviews every
month.
That was a time to live in.

> But I do see what you mean.. I am obviously biased for my games :),

No, but it still doesn't work on my Nova no matter how good it is. ;-)

> >I still don't understand where I wrote that your games were trash?

Unfortunaly you sometimes have to as they just don't work!

Ask Anthony. He has already borrowed his monitor to some bloke.

> >You do have a PC don't you? Or can it only display 16 colours as well?
>
> Eeerm what would that have to do with it?, I have had a PC in one
> form or another for around 4 or maybe 5 yrs... it has nothing to do
> with making games falcon enhanced?

I was thinking of the graphics. I can understand that it's hard to make
256
colour graphics or 16-bit graphics on a ST but as you have got a PC you
can do it on that thingy. Then you just recompile your games with these
new graphics and there you have a nice looking Falcon game! Easy isn't
it?
If it is as easy to do with STOS as it should be you don't even have to
test it as the only thing you did was to change the graphics from the
ST version.

:-)

;-)

You must not read so much between the lines all the times. Sometimes we
are
more or less ironic and you shouldn't take everything so personal. After
all
we all know how you react and sometimes we just can't help it and we say
a few things which we knows will trigger you off. Atleast that it how I
sees
on it, but as I speak for everyone in here it's the truth. ;-)

:-)

>
> Yep great for a nice WP... not so great for an 8 way scrolling
> platformer.....

Why not? Because someone hasn't done it it's not said that it can't be
done,
atleast with a decent box with a graphics card. On a ST it wont be
possible
if you don't use mono mode and maybe even then it can't be done.

For strategy games GEM should be used. In games like the old great
Popoulus
or Civialzations if would be preferd if GEM was used and it would also
have
ment that it would work on everything from a ST to the latest clones.

So what is the problem? ATOS is great (even though it's all in german)
and is available in both ST-Guide format _and_ html. :-)

Why? Is it impossible to recompile them with enhanced graphics without a
Falcon?
Do you need to change stuff in ther as well?

> > Just making Falcon
> > compatible games isn't enough.
>

Exactly. Talking about games, I tried Lotus 0.6 yesterday and this
looked cool!
Have you tried it?

> > > Falcon video modes correctly. NOVA, well who knows? Magnus, if you mail me

I realy wonder about this. I do also recall Doug saying something like
that, but
is it true? I have never dared to try. Maybe I should. You can't find
anything
about it in the sources? Has anyone looked?

> is definately possible. Adding it to my existing 16-bit mode routines wouldn't

Someone... that is the problem. We need more "someones". :-)

> > VDI supports resolution changes on the fly, but I have no looked into it
> > yet.
>
> Well STOS doesn't get on too well with the VDI...

Well, I'm not sure how it works or if it's the "VDI" who takes care of
it or
if it's the "Nova VDI" or whatever it is... Maybe I should try to find
out.

Hehehe... sure. :-)

Hey! perot@suse.modem.stud.uni-hannover.de (Peter Rottengatter) wasn't
it Thu, 19 Feb 1998 09:13:48 GMT that you wrote:

>> and you don't have a standard atari setup capable of atari low rez

>standard resolutions. You said yourself that one would need ST-Low in
>order to run all STOS derived software.

No I did not!!... You are telling lies to try and win a debate,

>If the programmer himself says his product won't run on my machine, I

The programmer says the software he makes, will work on all ATARI's
up to and including Falcons and TT machines capable of ATARI low res..

The above is what i said..why change it? why tell lies and why try to
twist my words.. they are there in all the thread plain for everyone
to see... well everyone bar you it would seem ?

>it works in terms of both hardware and software. I see no reason why
>you should have problems talking to me about low rez software. This

Because you do not have an ATARI machine capable of seeing low rez
and thus cannot try the software in question and thus cannot make a
judgment as to wether it is worth the effort of obtaining that
resolution.. please explain what part of this you are having such
difficulty with?

>software deal with 960x544 and 1024x864. I still have a machine with
>ST-High, but as far as I've been told, STOS software won't even run on
>that one (and that's a standard resolution, that's for sure).
>

STOS has been capable of high rez since it was original made..

The trouble with you Peter is that you are listening to people who
dont know.. you are listening to rumours... this is why you cant talk
about it.. because you havent seen it... you are guessing ... i am
talking to someone who doesnt know what he is talking about..how can
you even attempt to debate something that you know nothing about ?....

Ho yeagh... you could always try and lie your way through the
debate...

>I'll never understand why diskzines need their own, proprietary, non-GEM
>shell, so that you surely can't do anything else in the background. I like

Its called Mutimedia presentation and started well before the
popularity of mutitasking enviroments, people with presentation in
mind thought it worth the effort for people to use the resolution to
read the diskzine,

A diskzine is normaly something you run and take your time to read..
like a good magazine only on disk, If it where an APP or a tool that
was only run for a short period then yes you would be right..but some
consider the effort worth it,

However as I already conceded.. HTML or simmilar is far better
equipped for the task.. but then its many years since I ran a
diskmag... I just made the shells for others at there requests... If I
was to run a diskmag now.. it would surely be in HTML and definatly
not with one of the shells I make...

>Good, but there is more to modern computing environments than resolution
>independence. I agree with Magnus, and would say that software that seizes
>the entire system is, if not stone age, then bronze age.

But how can you say that when you can't try the software to make the
decision as to wether its worth the effort ?... ho yeagh. your
guessing again arn't you ?

>Good question. But in the case with Novas I don't think it's going to be
>very easy, unfortunately, as it hsa got a completely different screen

 I recall around 20 yrs ago seeing a program on UK tv called
"Tommorows World", they suggested that one day all homes would have a
computer more powerfull than any currently in existance, that all
homes would have the ability to show there own films, and a whole lot
more...
 I didn't believe a word of it.....then I grew up

 The moral being.. I am going nowhere yet...One day it will happen :)

>layout. If STOS would use some kind of graphics library which it
>used for all screen outputs (like Apex 3 have there you just replace
>the screen driver with either a Videl or Nova driver) it would be an
>easy
>task to write any game for any graphics type/card whatever. But I guess
>that
>will not happen as it would probbably mean rewriting STOS. While we are

 Why will that never happen... you are very narrow minded for a
computer enthusiast, I would have thought that you could see furthur
forward than that... please excplain why you think this may never
happen ?....is the world going to end... is it flat ? :)))

>on
>it, why not rewrite STOS? Anthiny has made so many patches to it so it's
>basicly already is a new program.

 yet a paragrpah ago you said it probably won't happen.. and now you
say why not do it..... late night was it ?

>> hmm, Well 5 years ago when lots of people where making games, I was
>> getting 80-90 scores.....
>
>You did? Cool, but 5 years ago wasn't exactly very busy games wise

 eh ?.....excuse me for being big headed... but havnt you seen the
software I made all those years ago ?, please do (if you have time)
pop along to my web site.. all titles are listed with screen shots and
independant reviews and a whole load more....

>Talk about 87-92 when you could read about 20 new game reviews every
>month.That was a time to live in.

 I am using the same ATARI computer that was available then... that
everyone else had.. I amke the games today on a STe... so maybe I
could have got rich back then :)

>> put my software "in the trash", this is what got me to respond in this
>> way, it was not exactly supportive was it :(
>
>No, but it still doesn't work on my Nova no matter how good it is. ;-)

 ok... this makes it alright for you to say all these things in a
public newsgroup... because YOU have a nova?... ooooer

>> >Well, how hard would it be to add better graphics to the Falcon
>> >versions?
>>
>> For me very hard.....but for a Falcon owner it would be easy..
>

>Why would it be hard for you?

 Duh! because I don't have a Falcon..... I can support the falcon and make games that work on them... But I would be working blind if I tried to use falcon enhancements... ho its ok saying use game testers.... but I may compile a game 20 times in one day near the end... this would be unworkable.. plus I would still not be able to see what they see or judge anything..

 I like to ask for game testers who have a TT and ST or falcon and ST then they can run on both.... if they both run the same then success:) and I know what the falcon version looks like...

>> >You do have a PC don't you? Or can it only display 16 colours as well?
>>
>> Eeerm what would that have to do with it?, I have had a PC in one

>I was thinking of the graphics. I can understand that it's hard to make

 haaa. right.. something else you are not aware of... sorry but I am not even capable of drawing a box. I am terrible at art, I really am.. so I have to get a contact.. he has exactly the same setup as me.. ste 4meg.. no HD.. but he does have a drive B that must be handy :)

 believe me it took a couple of years to find this guy... artists are very hard to find.. very hard.. believe me I know :(

>If it is as easy to do with STOS as it should be you don't even have to
>test it as the only thing you did was to change the graphics from the
>ST version.

 ha!....dont be silly... hahahaha... you think it is that simple... hahahaha sorry but it is not that simple at all...hahahahaha

 I want to support the falcon as well... I dont want to make falcon games and NOT fm games do I?

I guess you didn't see the smileys, did you? I was trying to joke, a bad
one,
bad still a joke. You can choose which damned machine you want.

Did I say that your pages are bad? They are not, infact they are quite
good if you
ask me and why do you have to pick on the www.atar.de site all the time?
Don't
you have better things to do? They have made a misstake, but most people
wont even
notice it. Tell them insteed of just saying it's a crap page, as it
isn't. For
a change they even tries to do something usefull with the pages and
offer others

to join them with their own pages under the atari.de domain which is a
great idea.

Sounds pretty interesting. You say a DLL like manager. So the "DLL"

would be Atari specific? Example; I have an ISA adapter (for an ATI
Mach 64 video card) installed on my Falcon. I would love to be able to
utilize the ISA adapter for other cards (aka video capture) but alas
no driver or software is available.

No, first word is the type of the picture, i.e. if it's PI1, PI2,
etc. After that, 16 words (32 bytes) palette. At offset 34 is the
picture data. At the end of the file, SOME programs save an extra
32 byte, used for colour animation, I believe, but I'm not sure about
that. Those 32 bytes are usually not used on normal viewers, but they
may very well be.

Is there a VDI call that enables a text cursor in GEM windows?

I'm trying to write a simple text editor and just can't find a way of
showing a cursor other than keeping track of the position and using v_box()
to draw the cursor.

David

Yes. It would be Atari specific. It doesn't handle Wintel DLLs.

All one would need to do is add a few lines to the applications to check
for the presence of the Toolbox.

Once the Toolbox has been found by an application, the app can make calls
to it, and load/unload libraries (which could be software modules for
application programs, drivers for hardware, system patches/extensions).

Libraries can be loaded at boot time, and made available for all apps. Or
an application can load one of its own libraries at run time.

(It is _NOT_ an "overlay manager". Libraries run in one part of RAM,
separate from the application)

It does not need MiNT, but will happily coexist.

I'll be making the API available shortly.

Um - why should a compiler need to have this feature?

It is nice for compatibility, but definitely not a must. As far as GEMDOS
and (X)BIOS is concerned, it is useless since you can't tell the compiler to
put a trap instead of the jsr/bsr instruction, so you need a callable
library for these functions anyway.

Um - No. There are 1040/MegaST machines with up to 15.5MB of ST-RAM. Do not
assume a 'standard' upper limit of 4MB.

>machines lifted this to 10, and then 14 megs. ("Fast RAM" is addressed

Yes. This method is used all over the TOS and is save.

>I seem to recall something about the 68000 not being able to recover
>properly from buserrors (or was it just restart/continue)

It can't do a restart/rerun of the command that caused the error, which makes it (neraly) impossible to implement virtual memory schemes.

Note: The 68030 does a restart by default, which means that setting the buserror vector to RTE will work on the 68000, but will yield an endless loop on the '030.

```

>    ...
>
>
>mybus   move.l   a3,sp    ; reset SP to old value
>    bra  ool  ; go to next instruction beyond memtest loop
```

This looks just fine - except for the fact that you won't find the correct amount of memory in STs equipped with a MagnumST ramcard. These have the normal ST RAM (up to 4MB), plus up to three blocks of alternate RAM (one up to $DFFFFF, and two 512K blocks not starting on 512K boundaries somewhere above).

Furthermore, your scan may confuse other expansions, and it mmight mix up memory on a non-ram expansion board (eg. video card, ethernet etc.) with main memory.

oops - my error : $FE000000 to $FEFFFFFF is reserved for 24-bit VME,
according to the Compendium.

I also test from $01000000 up to $FE000000, but didn't include it in the
source I posted with my first message to this thread. (I abort the
memtest at the first buserr, or when hitting addr 4064 MB [=$FE000000])

> Do not make any such assumptions ! You have to test for 16 MB on a 68000
> system and for 4GB on a 680x0 system (x being 2 and larger).

Does such hardware exist? (I'd have thought it'd be better to put memory
as one contiguous block from $01000000 [$01000000-$88FFFFFF], instead of
$01000000-$01FFFFFF, $80000000-$87FFFFFF, for example)

> With your way, you'd miss memory that I'd put, say, at $80000000 !

What about the system ROMs at $00E00000 (or $00FC0000 for the older ones)

I would think it's better to stop at 14M when testing standard RAM.

I've been informed that the 68000 doesn't put enough info into its BUSERR
stack frame to allow it to continue/restart the failing instruction

> I'd strongly suggest to disable all interrupts during your memory testing :
> or #$0700, sr

Done.

Thanks for the response.

Its explained in the MagiC programming docs, which unfortunetly for many
of us are only available in German.

You don't want to continue or restart it, but simply abort it, which is
possible on any m68k model, eg. like this:

```
     move.l   %sp,%a0       | save stack pointer
     move.l   8,%a1         | save old buserror handler
     move.l   #buserr,8 | set new buserror handler
     clr.l    %d0      | initialize flag
     tst.b    (%a2)         | %a2 is address to test
     nop           | synchronize with bus
     moveq    #1,%d0        | set flag if it worked
buserr:
     move.l   %a0,%sp       | discard exception frame, if any
```

```
     move.l   %a1,8         | restore buserror handler
```

Are you still programming your old 8-bit? Do you specialize in
writing games?

Lots of people (well, say several at least) still want new software
for their old Atari 8-bit (400-800 XL/XE) computer systems. A certain
national distributor I know (Video 61 / Atari Sales) wants to fashon
cartridge games from new software. His deal with me is (X amount) per
cartridge which he pays when he makes them up. No, Im not getting
rich, but I do have a place to go to get some cash, while helping
the Atari community (who else will?)

I have to supply the software formatted for his E-Prom burner (not
difficult) along with the instructions on how to play. He gets to
decide how many to make (usually 6 at a time) and sells them to his
customers.

If you can write games that are 16K or less, and want to get in on this
action, click on the link below (or reply E-mail) for more information.

By the way, games may sell better, but anything that would be useful
on a cartridge might be acceptable!!!

Again, THIS IS NOT A GET RICH QUICK SCHEME (scam) :)

What I plan to do is to compile a list of interested parties, (by
about March 13th) then send him the list. He indicated he wanted more
programmers, so he may contact you. Note, he is already very
busy answering the phone for orders and such so that I wont post his
voice number here, his BBS # is (612) 462-3680 (BBS Express Pro).

"Games keep people happy"

I've also had problems with this (and gave up), my guess is that GAS uses
something a.out-ish. You'd have to take a look at the binutil sources
(and headerfiles!) to get more info. These should be available from most
Atari FTP sites.

:   Is it possible to convert them to PureC or DRI compatible somehow,
: or any other usable format other than GNU's?

Er, yeah, that would be nice... I dunno. You could try compiling with -S and
then use another assembler on the output files, although I doubt that would
work as GNU assembly syntax is a bit weird.

And what does those diskzine-shells consist of? Animations, scrollers, music, sprites... Much like a game really, and exactly the thing STOS is good at. But try booting one of those shells on my Falcon/Afterburner...

>>of any language that is subject to the same restrictions. What STOS

> No restrictions here mate? :)

Well, try writing a threaded GEM-application in STOS... I'm sure it can be done with a lot of pokes and peeks, but I prefer using a language designed for "serious" (flamebait!) programming and save myself a lot of time and problems.

And the other way around: If I want to write a hardware-dependent platform-game I'd probably do it in STOS with one of those (pretty cool I have to admit) extensions. It can be done in C as well, but then I'd have to spend a lot of time writing a graphics-library and reinventing the wheel. But if somebody wrote such a library for me I'd use C...

Are you saying that there actually exist software written in STOS that
works on a Afterburner? I have never managed to get STOS-games to
work on my AB... OK, so I haven't tried it since you released your
latest platformer (Was it Heartland? I can't remember, but I
downloaded it from your website four/five months ago), but that's
pretty recent. But it didn't work. Worked fine on my Mega though :-)

> If you have tried them then they should/must work, if you havn't tried

I admit I haven't tried the latest diskmags on my Falcon, but I
assumed ("assumptions is the mother of all fuck-ups") that they didn't

work since I couldn't get the latest STOS-games to work either.

> Why not get your facts right BEFORE talking crap :(((

You're pretty sensitive when it comes to your favourite
programming-language Tony...

>> And what!?....they DO WORK?...what are you saying? that they don't?.

>Are you saying that there actually exist software written in STOS that
>*works* on a Afterburner? I have never managed to get STOS-games to

 First of all I do not own a Falcon, But from feedback I have been
told yes! they do :)

>work on my AB... OK, so I haven't tried it since you released your
>latest platformer (Was it Heartland? I can't remember, but I

 After Heartland was Diamond Ice, After that was BillyBoy and
inbetween was Autoview and a new diskmag shell, Also a made to order
Cheat database soemone is filling up for release and then there was
the re-release of diamond Ice for TT owners...Thinker was almost
completed before the artist went Awol and I started a whole new
venture that needed a new web page making, Also I started a VidIgrid
v3 especialy for Falcon and TT owners...

 So a few things since Heartland <smile>

>downloaded it from your website four/five months ago), but that's
>pretty recent. But it didn't work. Worked fine on my Mega though :-)

 hehe Glad to hear it..But no I had not implemented the new routines
at that time and we have had yet another upgraded STOS compiler or two
since then :)

>assumed ("assumptions is the mother of all fuck-ups") that they didn't
>work since I couldn't get the latest STOS-games to work either.

 You CAN get the latest STOS games to work, maybe not the ones you
tried, and Heartland as explained is far from the latest,
>
>> Why not get your facts right BEFORE talking crap :(((
>
>You're pretty sensitive when it comes to your favourite
>programming-language Tony...

 Yes....But as you already know that, then you must have expected the
response? <Big Smile> no insults where intended ....

 BTW you should have seen the first draft of my reply...phew! ;-)

> $01000000-$01FFFFFF, $80000000-$87FFFFFF, for example)

It's better, but in no way enforced by the system. The hardware hacker might have good reason to add memory in two chunks.

BTW.: There is no really proper way to achieve your initial goal. Some hardware add-ons provide RAM on-card. As an example, I have a Riebl ethernet card here. You'll detect RAM from $e00000 to $e0ffff, which is not distinguishable from ordinary system RAM, yet you must not access it because otherwise you'll badly disturb the hardware driver's operation. Consequently, it's *not* added to the system via Maddalt().

If you're after the amount of memory that you're allowed to access freely in your software, I recommend a completely different approach :

```
go_to_supervisor_mode;
switch_interrupts_off_entirely;

do {
     use_Malloc(-1)_to_find_out_size_of_largest_block;
     feed_that_number_into_Malloc()_to_allocate_the_block;
     put_address_of_block_into_a_list;
     sum_up_block_size;
 } while (block_size > 2);

walk_the_list,_with_each_entry {
     feed_address_into_Mfree()_to_free_the_block_again;
   }

switch_interrupts_on_like_has_been_before;
leave_supervisor_mode;
```

You'll end up with the true amount of free memory summed up during the
first loop.

> What about the system ROMs at $00E00000 (or $00FC0000 for the older ones)
>
> I would think it's better to stop at 14M when testing standard RAM.

Why ? Why shouldn't I add RAM at those addresses ? Neither of my machines
has ROM there. The only reserved bit is the area beyond $ff0000 (and $ffff0000
on 680x0 CPUs). Everyone who puts RAM there violates specifications by Atari.

>> TOS uses them during initialization stage !
>
> I've been informed that the 68000 doesn't put enough info into its BUSERR
> stack frame to allow it to continue/restart the failing instruction

Then your informer told you a fair bit of rubbish. The info that's there is
perfectly enough to recover from the bus error completely.

BTW.: The only way the CPU is affected by the bus error is that the state is
set to Supervisor mode. That's all. Concerning memory, some info is placed
on the system stack, you gotta remove it for recovering from the bus error.
You also need to restore the status register, which is part of the saved info.

Cheers Peter

> *works* on a Afterburner?

I cannot confirm that, but I can say that STOS works well on my FX'd
Falcon - both normal ST compatible software, and Falcon enhanced/only.

STOS doesn't make use of the PMMU, and Tony's software doesn't touch the
cache, so I dont see any real reason for it to behave any differently on
an 040 to an 030 - although I dont know details of 040 problems (mail me
if you find some with STOS and I'll try and fix 'em!). STOS will *not*
make use of ALT-ram, though (without directly calling mxalloc, which
is not currently done by any routine/extension).

> I have never managed to get STOS-games to
> work on my AB... OK, so I haven't tried it since you released your

Details of what the problem was might be helpful... Nobody has mailed me
about AB040 compatibility... (I am the one who has released the recent
compatibility patches to STOS). Maybe this is the same problem as Tony
has trying to find TT testers (very few come forward).

This comment is not particularly aimed at you Jo, but why do people sit
on bug reports like this? It is sometimes possible to solve compatibility
problems, but if you dont know that they exist 'cause people just give
up and say "oh well, it didn't work" then it'll never get solved!

> > If you have tried them then they should/must work, if you havn't tried

Never assume, 'cause you'll make an ASS out of U and ME. :)

> > Why not get your facts right BEFORE talking crap :(((
>

> You're pretty sensitive when it comes to your favourite
> programming-language Tony...

Yea, but seeing as your post was entirely based on a (possibly incorrect)
assumption that was critical of Tony's software, you can understand why. :)

It should be rather straight forward I think. I also think that there
were a
short example with the docs, or?

Also Thomas Binder has made a XFS drive so maybe he can help.

>
> Cheers,
> Olivier.
>

I have experienced similar problems with MiNT and STinG. Version 1.04
was OK, but v1.12 crashed all the time. I found the problem was with
the order in which MiNT and STinG were loading from the AUTO folder.
I found that if STinG loaded before MiNT, STinG would crash, and a
privilege violation error would appear on screen. Re-arranging the

AUTO folder so that STinG loaded last and after MiNT solved this
problem, and I havn't had a crash since.

Hope this helps.

Regards,

Ben Hills.

Do you know if it is possible to find converter programs that can translate
680x0 source codes in C.
(Or better, than can translate 68000 source code in 6502)
Of course, I know that such a program will generate crappy code...
My objective is just to have something I can recompile, and that I will
optimise after.
If I cannot find, I will be able to do it myself :(
This converter wouldn't have to handle self-modifying code. The syntax used
in assembler can be adapted by me, it's not really a trouble.
It should be able to locate and handle correctly CODE / DATA / BSS sections.

Thanks.

It does come in handy when you want to use shared libs or DLL's...

: It is nice for compatibility, but definitely not a must.

Depends. It is a must if you want a _decent_ (ie. not completely
incompatible binary-wise) C compiler.

With this calling convention you can use object files
generated by other compilers (C, Fortran, Pascal,
Mudula, assembler etc.), in your C program and,
ofcourse, the other way around, use C functions in
one of the other languages. There is a standard
calling convention and object file format, so you can
use objectfiles of different compilers to create a
program.

>GEM and Assembly Language are two things that don't go together easily.
Hum.
I will say definitely NO.
I will perhaps say some bullshits in what follows, but since I do not
program on ST since 2 years I think I can be excused....
If you're using Devpack (or GenST if you prefer), with MonST, it's really
easy to code GEM applications in 680x0.
First, theses packages come with a lot of usefull MACROES that helps you
implement any system call (BIOS,XBIOS,GEMDOS,AES,VDI). If some functions are
missing, it's really to add what you want in these macro files.
An example of GEM code (from the real world: The complete source code is on
my home page [with French comments, sorry]), made using this method:

```
...
type_window=win_name+win_closer+win_mover+win_info
...
; Compute window size, base on formular size
form_center        ptr_main_page
move.l                 ptr_main_page,a0
wind_calc #0,#type_window,ob_x(a0),ob_y(a0),ob_l(a0),ob_h(a0)
; Memorize window size
move.l int_out+2,x_win
move.l int_out+6,w_win

; Read again window size
movem x_win,d0-d3
; Create the window
wind_create #type_win,x_win,y_win,w_win,h_win
```

```
;  Memorize window handle
move d0,handle_win

; String address
move.l #window_title,int_in+4
; Set the window title
wind_set handle_fen,#2

; String address
move.l #infos_window,int_in+4
; Set the window information line
wind_set handle_fen,#3

; Open the window
wind_open handle_win,x_win,y_win,w_win,h_win
...
...
...
```

And so on. It's easy to Init the application, to read the cookie jar, to convert and reallocate
ressource file, to change object flags...

>To be absolutely honest, I doubt you would understand the source code without
>understanding the mechanisms first. Windows are the worst of all and can be
>problematic at best even in C. I suggest you read; 'The ST Assembly Language
>Workshop Vol II' by Clayton Walnum and the ProGEM series by Tim Oren. Both
>are published in electronic form and are shareware and freeware respectively.
>You can find them in most Atari archives.
Coding GEM in C, ASM, or Basic, (or in Modula 2 ?) is not the question. If you know how GEM is working, and it's philosophy... you can code it efficiently in the language you want.

>Good luck.
Same thing !

For those people that want to download the (complete) source code, just look for the REMBRANDT archive on my Atari download page.
The code is fully functionning, is fully commented (in french of course :), and contain plenty of interesting stuff in GEM, NON GEM, all is in 68030 !!!! (meaning: Falcon or TT only).
But the GEM part is compatible with any ST compatible computer.

See ya,
Mike.

I don't use Lattice so am not familiar with these functions. However, there is nothing stopping you doing whatever you want to any cookie in the jar (the side effects might be undesirable though). The cookie pointer is stored in location $5A0 and this will be NULL if there is no jar at all. Otherwise, it will be the address of the cookie array. This array is of unknown size to you initially - you have to look at each entry in turn until you come across the last one which is denoted by the fact it has no name (NULL). The value for this unnamed cookie specifies how big the jar currently is. So if the last entry is using the last slot you have to be prepared to make the jar bigger - current_size + 8 more slots seems to be the convention. Your program

must allocate the memory, copy all the current cookie entries to the
new space and set up the unnamed one correctly. This is why your
program cannot terminate.

>Overwriting an existing cookie with a new value; perhaps putcookie() will
>do this anyway? ...hmm, I forgot to check.

Btw, in versions of tos < 1.6 you need code to clear the cookie on a
system reset.

The level of security you want to implement is important. At its most basic you could simply create a cookie with a FALSE value via an auto folder program provided it does not already exist. Your login program will check this and terminate quietly if the value is TRUE. When the value is FALSE then it will require a password and only set the cookie to TRUE when a valid one has been entered.

>Perhaps there's already a way round my little problem or, there's a serious
>flaw in my design, but I guess that's why I've posted my message here. ;-)

The security may or may not be an issue. It would be relatively easy to bypass the above simply by writing a small auto folder routine which creates a cookie of the required name with a value of TRUE. This could be considered acceptable however, because someone with the knowledge to do this would find it much easier to boot the machine off a floppy, load the hard disk driver manually then delete your login program.

Another problem is that the cookie you use is "documented" in that its name and contents are available to any utility which cares to examine it.

Possibly you could write a small gem parallel process to be loaded from the magic auto/apps folder. This would stay resident until it received an AP_TERM message whereupon action could be taken to ensure the next login is bypassed. Unfortunately I'm not sure what the situation would be if one of the processes currently running ignored its AP_TERM. You'd need to experiment with this.

> what the main differences are). Have you done any docs yet?

It's not quite as "buzzword compliant" as the component manager.

No docs yet. Every time I sit down to write them, I seem to either get
called away to do something, or find another place where the Toolbox code
can be further improved, which leads me into another five or six hours of
coding.

The zip file contains the Toolbox, C header files, an [admittedly
simplistic] example library, and an "About Your Atari" info program which
uses some of the builtin Toolbox funcs, and a library enumerator program
to tell you which libs are loaded and info about them

I can upload the zip file to the University Of Michigan site (was that

alt.archives.umich.edu? I haven't used it in yonks, so that might be in error).

(It costs me in data-transfer charges to email/ftp/web etc, so if there is a better site that will be reachable by more users, please tell us)

I've made some major changes to it architecturally since I took part in an email discussion about six months ago with a few other people interested in DLL schemes.

The <quote> "slow and overprotecting" <unquote> OO-like scheme for loading, unloading, and calling libraries is still there, but a faster, unprotected direct-call interface now exists.

Here is a simple minded routine to delete a cookie

```
typedef struct  {
     uint32 item;
     uint32 value;
} Cookie;

void deletecookie( uint32 cookie )
{
  register Cookie *cp;  // pointer to cookies
  void *sp = NULL; // saved stack pointer

  if( !Super( 1L ) )   // are we in supervisor mode?
```

```
    sp = Super( NULL );  // no, so change to it

  cp = (Cookie *) 0x5a0;    // get pointer to cookie jar
  if( cp )  {          // if jar exists
    while( cp -> item )  {  // are we at end of list?
      if( cp -> item == cookie )  // is this the cookie we want to delete?
         break;   // yep, so break out of loop
      cp++;   // increment pointer
    }
    if( cp -> item )  {  // is this a null cookie?
      do  {   // overwrite this cookie with next in list
        // (cp + 1) points to next cookie  ie addr + 8
        memmove( cp, cp + 1, sizeof( Cookie ) );
     cp++;    // increment pointer
      } while( cp[-1] -> item );  // loop until null cookie copied
    }
  }

  if( sp )  // if we switched stacks
    Super( sp );   // restore old stack
```

Now it's you who's talking crap. It's a dead wrong assumption that Atari Low
resolution is available on all machines. Meanwhile there is in fact a huge
number of machines not providing Low resolution at all. Neither my enhanced
520ST+, nor my Mega ST has Atari Low, and people using Medusas and Hades,
let alone Macs with MagiCMac, and MagiC-PC probably have never seen ST-Low.
I doubt very much that the upcoming Milan will have ST-Low.

> If you have tried them then they should/must work,

Only really proper programming "should/must work", and proper programming
is resolution independent.

BTW Have you ever considered that for many many people, whose machines really
do have ST-Low, it's a real hassle to switch to ST-Low ? I still have a 1040
machine with ST-Low, but I'd need to carry it around and probably find a TV
set to connect it to, because I (and never of my local friends) do not have
any colour monitor. A diskzine that uses STOS is crap for me, I cannot read
it.

Cheers Peter

Why don't you read the FAQ ? It's all explained there. Due to insufficiencies
in MiNT, every AUTO program that bends system vectors needs to run *after*
MiNT in the AUTO folder ! This holds for STinG too.

Ok, it's not a must by definition, but it certainly is for any sensible
programmer. There is only one common, definitely compatible way of passing
parameters, and that's this one. If you think compatibility is not important
here, then you've never worked with third party libraries for which usually
the source code is not available. Take any of the number of GEM libraries
available as an example. They cannot be used unless the compiler is capable
of standard argument passing.

Oh, so you are saying that they work on my Falcon/AB040/Nova box in
16-bit high
res? Cool.

I still have to find a GEM shell which doesn't and have to launch a
program in
a certain resolution sounds like stone age to me. It will go into the
trash even
before it comes near my computer. We are not still living in the middle
ages
you know.

;-)

Greetings Gaven, thanks for the code, but...

```
typedef struct  {
        uint32 item;
        uint32 value;
} Cookie;

[snip]

    cp = (Cookie *) 0x5a0;          // get pointer to cookie jar

    [snip]

    if( cp -> item )  {     // is this a null cookie?
      do  {                 // overwrite this cookie with next in list
        // (cp + 1) points to next cookie  ie addr + 8
        memmove( cp, cp + 1, sizeof( Cookie ) );
        cp++;                       // increment pointer
      } while( cp[-1] -> item );    // loop until null cookie copied
    }
                  /\
                 /||\
                  ||
                 Error: invalid structure reference.
```

This is the error generated by LC 5.6. I can't work out what you may have meant by this, so I'm stuck. I do appriecate your help, and good use of comments too (i.e. heaps of 'em, very handy!), but the code is no good to me at the moment. I tried compiling it without the [-1] and although it compilied ok, it wouldn't delete the cookie I asked it to do.

Karl.

Ah! There is enough information to "regain control" lets say but there
isn't enough information there to be able to guarantee a restart of
the offending instruction - iirc not enough info is stored to tell
whereabouts in the instruction the program counter was when it went
pear-shaped.

The only text cursor the vdi has (other than being in text mode
proper) is the one displayed by an editable text box which I doubt is
going to be particularly suitable for your needs!

[Since I've got trouble with news server when I send this post, I post it again. Sorry if it is duplicated !]

>GEM and Assembly Language are two things that don't go together easily.
Hum.
I will say definitely NO.
I will perhaps say some bullshits in what follows, but since I do not program on ST since 2 years I think I can be excused....
If you're using Devpack (or GenST if you prefer), with MonST, it's really easy to code GEM applications in 680x0.
First, theses packages come with a lot of usefull MACROES that helps you implement any system call (BIOS,XBIOS,GEMDOS,AES,VDI). If some functions are missing, it's really to add what you want in these macro files.
An example of GEM code (from the real world: The complete source code is on my home page [with French comments, sorry]), made using this method:

```
...
type_window=win_name+win_closer+win_mover+win_info
...
; Compute window size, base on formular size
form_center        ptr_main_page
move.l                 ptr_main_page,a0
wind_calc #0,#type_window,ob_x(a0),ob_y(a0),ob_l(a0),ob_h(a0)
; Memorize window size
move.l int_out+2,x_win
move.l int_out+6,w_win

; Read again window size
movem x_win,d0-d3
; Create the window
wind_create #type_win,x_win,y_win,w_win,h_win
;  Memorize window handle
move d0,handle_win

; String address
move.l #window_title,int_in+4
; Set the window title
wind_set handle_fen,#2

; String address
move.l #infos_window,int_in+4
; Set the window information line
wind_set handle_fen,#3

; Open the window
wind_open handle_win,x_win,y_win,w_win,h_win
...
...
...
```

And so on. It's easy to Init the application, to read the cookie jar, to convert and reallocate
ressource file, to change object flags...

>To be absolutely honest, I doubt you would understand the source code without
>understanding the mechanisms first. Windows are the worst of all and can be
>problematic at best even in C. I suggest you read; 'The ST Assembly Language
>Workshop Vol II' by Clayton Walnum and the ProGEM series by Tim Oren. Both
>are published in electronic form and are shareware and freeware respectively.
>You can find them in most Atari archives.
Coding GEM in C, ASM, or Basic, (or in Modula 2 ?) is not the question. If you know how GEM is working, and it's philosophy... you can code it efficiently in the language you want.

>Good luck.
Same thing !

For those people that want to download the (complete) source code, just look for the REMBRANDT archive on my Atari download page.
The code is fully functionning, is fully commented (in french of course :), and contain plenty of interesting stuff in GEM, NON GEM, all is in 68030 !!!! (meaning: Falcon or TT only).
But the GEM part is compatible with any ST compatible computer.

See ya,
Mike.

VDI on a decent graphics-card will be a lot faster than anything you can do in assembler on the Videl... But to make games on older computers (i.e. ST->TT) VDI is a no-no for anything else than Pacman and Tetris.

Date: 1998/02/09
Message-ID: <34df90b7.0@comnet.co.nz>#1/1
X-Deja-AN: 323569017
Newsgroups: comp.sys.m68k,comp.sys.atari.programmer

As part of a system-level utility I am writing for the 68000-based Atari ST, I need to validate the amount of RAM in the computer.

To do this, I wrote a small loop testing bytes at pre-defined intervals, until I receive a buserror or I have reached the end of the documented RAM space.

The 16 bit Ataris have a 4 meg physical Standard-RAM limit, but the 32 bit machines lifted this to 10, and then 14 megs. ("Fast RAM" is addressed from $01000000 up to address $FF000000)

However, will there be any problems if I just ignore the buserr, and just JMP to the next instruction after the test loop? I am using a 68030 system, and no harm seems to befall it when I do, but will a 68000 be able to survive?

I seem to recall something about the 68000 not being able to recover properly from buserrors (or was it just restart/continue)

My loop looks something like this:

```
     ; 14 meg address space, in multiples of half-a-meg
     ; we need to loop (14*2) times, but use a DBF value of 27
     move.w   #(14*2)-1,d0  ; d0 = dbf count
     move.l   #524288,d1    ; increment = 512k
     lea  0,a0     ; base address = 0
     move.l   buserr(a1),a2 ; save old buserr handler
     move.l   #mybus,buserr(a1)  ; set new handler
     move.l   sp,a3         ; save stack pointer
tol  tst.b    (a0)     ; does byte exist? (buserr possible)
     add.l    d1,a0         ; increment pointer
```

```
     dbf  d0,tol        ; loop
ool  move.l   a2,buserr(a1) ; restore old buserr handler
     move.l   a0,ram        ; save top of standard RAM
     ...

mybus    move.l   a3,sp    ; reset SP to old value
     bra  ool  ; go to next instruction beyond memtest loop
```

In article <6bl697$lk2$1@xenon.inbe.net>,
     "De Meester" <mdemeester@village.uunet.be> writes:

> Hello, can anyone give me an explanation of the command 'cdecl' in pure C???
> I can't work with the command. I use Pure C 1.0.

cdecl declares a function to use standard C parameter passing. Normally, if
you define a function

```
   void test (int foo, long *bar)
   {
    }
```

then Pure C will expect "foo" in CPU register D0, and "bar" in A0 ('cos it's a pointer), this is for efficiency.

For interfacing to external functions, sometimes standard passing is required. So

```
   void cdecl test (int foo, long *bar)
   {
    }
```

causes Pure C to assume both parameters on the stack, as every C compiler must be able to do, and which also is the standard passing scheme for GEMDOS and (X)BIOS functions.

cdecl therefore is a modifier, and not a command. Be aware that if you write prototypes separately, the cdecl must be in both prototype and definition of the function.

Cheers Peter

cdecl is a directive that tell to the compiler how to put and get
parameters for a C function. you must know that the directive is very
usefull with pure-c, because it use another technics to pass parameters.

pure-c work with registers. instead of to put and get paramters from the

stack, as a lot of compiler C does, it'll try to pass parameters with d0,d1,a0...

for example,   int toto(int a) . 'a' parameter will be put in the d0 register

but: int cdecl toto(int a). 'a' will be put in the stack.

so, in this function, if you write it in 680x0, you need to know if you want to use the register or the stack.
cdecl is standard C call parameters, and for example, i write always my 680x0 routines with this declaration, because i can use any C compiler with them, whereas if used the pure-c technics, it be possible only with the pure-c compiler... as you want....!!

conclusion:

cdecl = parameters in and from the stack
no directive = parameters in registers as possible.

(TOS use cdecl directive...because it is the C standard call.)

Hmmm ... can't help you much, but here's what I've got:

1. TOS keeps track of the physical top of
   ST-compatible RAM at the appropriately-
   named phystop, hex location 0x0000042E.
   0x00000432   _membot points to the
                 bottom of the system heap.
   0x00000436   _memtop points to the
                 top of the system heap.

2. ST compatible RAM space:

```
    0x000005B4    Beginning of ST RAM
    0x009FFFFF    End of ST RAM

3.  Reserved Space for Hardware Developers
    from the end of ST RAM to:
    0x00A00000    Mega STe
    0x00E00000    All other Atari computers

4.  VME A24:D16 Address Space (Mega STe only)
    (Used by Falcon030 for RAM)
    0x00A00000    Beginning of VME space
    0x00DEFFFF    End of VME space

5.  VME A16:D16 Address Space (Mega STe only)
    (Used by Falcon030 for RAM)(Available for
    ST-compatible RAM or I/O space)
    0x00DF0000    Beginning of VME space
    0x00DFFFFF    End of VME space

6.  System ROMs as of TOS 1.06
    0x00E00000    Beginning of System ROM
    0x00EFFFFF    End of System ROM

7.  Cartridge ROM
    0x00FA0000    Beginning of Cartridge ROM
    0x00FBFFFF    End of Cartridge ROM

8.  System ROMs before TOS 2.00
    0x00FC0000    Beginning of System ROM
    0x00FEFFFF    End of System ROM

9.  TT Fast RAM
    0x01000000    Beginning of Fast RAM
    0x01FFFFFF    End of Fast RAM

10. TT Reserved Space
    0x20000000    Beginning of Reserved Space
    0xFDFFFFFF    End of Reserved Space

11. VME A24:D16 Area
    0xFE000000    Beginning of VME Area
    0xFEFEFFFF    End of VME Area

12. VME A16:D16 Area
    0xFEFF0000    Beginning of VME Area
    0xFEFFFFFF    End of VME Area

13. Shadow Image (i.e., "unused" or "unusable")
    0xFF000000    Beginning of ST Compatibility Space
    0xFFFFFFFF    End of ST Compatibility Space

Source:  The Atari Compendium by Scott Sanders.
Toad Computers may still have the Compendium CD
```

available if you need one.

I've left out a lot of the non-memory stuff
(hardware addresses, etc.) since that's not
of interest to you at this time.

Hope this helps.

Hmm .. it's something to do with your ISP. When I connect to mine
Newsie sends my messages OUT before reading messages IN. I usually get
my OUT message returned to me in the same connection.

h, yes cubase audio is now version 2.06. Just upgrade it from
steinberg ftp site, it;s the full software, the only thing you need is
the dongle you have been using with your version 2.03.
That's all :)

Hi I'm new here.

I'm having problems with Cubase audio 2.03, the fact is that when I load the
songs from the SCSI HD or from the floopy some tracks are corrupted and
notes are missing, if i try loading again the song 3 or 4 times the problem
desapears.

If anyone can help me please leave a message in the newsgroup or contact to

You're thinking of another program, probably NewsExpress or something like
that, for the IBM systems. NEWSie is for the Atari ST systems, and is a
news reader.

The function return value will still be put in D0, which is the standard
m68k calling convention.

comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.atari.programmer,comp.sys.atari
.st.tech,ny.forsale,nyc.forsale

For Sale:

Very limited quantity network Adapter cards for the following Atari
Computer Systems:

Atari Mega ST's (MegaBus version)
Atari Mega STE and Atari TT030 (VME Version)

Note: The Atari Mega STE and TT030 slot can only accomodate (1) one
device, so if you are using a graphics card and want to also use the
network card this is NOT possible in a stock system

WARNING: Many Atari Mega STe's were sold with their VME PAL chips
removed, you will need to buy a set of PAL's and install then for these
adapters to work. To check and see if you have the PAL, open your Mega
STE and look at the 2 sockets close to the VME bus slot, if they are
present you are set, if they are missing you will need to contact B&C
Computervisions (Atari Sales & Service Center) 916-295-9270 or BEST
Electronics 408-243-6950 and order a set.

These cards are compatible with Linux, BSDnet/Atari, and Atari System V
Unix which all have the drivers to use these Ethernet adapter cards for
TCP/IP communication.

I have just recently acquired TOS drivers written by Atari Germany for
these cards, most of it is in Germany, but easy enough to understand,
the drivers are called TOS ANS (Atari Network Services), if someone can
upload these drivers to UMICH or someplace public I would like to place
these drivers up onto the Internet for everyones benefit.

Both versions (MegaBus and VME) are the same price:

Riebl Ethernet Adapters: $150 each (Includes 1 3.5" disk with TOS ANS
drivers and 1
"T" connector for the Ethernet card)

Shipping within the U.S. is $5.00 USPS Priority Mail, Shipping outside the US via ground is $8.00, via Air is $14.00

NOTE: Quantities are very limited, please contact me by email prior to sending payment to reserve a card.

Curt

Hi!

I've been programming an Art package(yes, another one...) in GFA Basic 3.5, but have run into an unfortunate snag when it comes to the palette.

I can load a Degas image onto the screen using BLOAD, and get it's palette to the screen using the ~XBIOS(6... call; but how can I get the values for the RGB intensities? I'd like to use them in a slider system for changing colours in the palette. The only way I've been able to get round this so far is by creating my own image format, but for compatibility's sake I'd like to be able to load Degas and/or Neochrome images.

Can anyone help?

Thanx in advance

Jim

(Never used GFA, but hopefully this info will come in handy)

The Degas header consisits of 34 bytes (as 17 two-byte words) prepended to the image data.

The first word (bytes zero and one) give the screen rez the image was for, and a flag saying "I'm Compressed". If bit 15 of this word is set, then the image file is a compressed Degas file. The low three bits (bits zero, one and two) give the screen resolution as returned by the Xbios call Getrez()

Following this word are 16 two byte words giving the palette, such that one could use a Setpalette() XBIOS call.

After the palette comes the image data - eithe compressed or uncompressed, depending on whether it is a PI? or PC? file.

(At least that is what i can recall of the Degas file format, when I last programmed it into an app of mine around 1992/3)

Sure, you have standard video, i.e. resolution etc. These pages have a fixed
width for instance, which is horrible for anything else but standard video.
The whole point of HTML is that the pages look well on all hardware.

> before. They are also under construction. so don't judge them to early.

They have big graphics, wasting bandwidth. IIRC they even put text into
graphics which is most stupid. They won't have done that if the final version
was meant to be different.

>> It's been the first time that I've seen somebody using white text on a
>> white background (!) It's ridiculous.
>

> Where did you find this? On your own pages? ;-)
> Seriously I couldn't find this anywhere at all. Tell me where?

All the following pages, for instance http://www.atari.de/messe.htm.
Someone said there was a background graphic, but even though I haven't
switched background graphics off, I did not get it. Still there is folx
who do switch them off, and they will definitely end up with white text
on white background, being utterly unreadable.

> BTW. Background colours looks to be something that they havn't masterd
> at all. Maybe it's a limitation in the webdesign program they use.

If so, the program should go into the bin. Still if they had to use it,
they would refrain from using color specifications at all, if they had
the faintest idea what they are doing (which they don't).

> for Atari users. Look at Wizztronics web pages. They are pathetic and
> looks like a bunch of kids have knocked them togheter in 5 minutes.

I can hardly believe that those pages should be worse.

Cheers Peter

Do not make any such assumptions ! You have to test for 16 MB on a 68000

system and for 4GB on a 680x0 system (x being 2 and larger). With your
way, you'd miss memory that I'd put, say, at $80000000 !

Of course the 68000 is perfectly capable of surviving bus errors properly.
TOS uses them during initialization stage !

I'd strongly suggest to disable all interrupts during your memory testing :
  or #$0700, sr

Cheers Peter

First, a factual point. The standard C library \emph{is} a part of the language. Every hosted implementation of C must have it. C without `printf' is an oxymoron.

Secondly, on the subject of C++ and printf; I've written a few bits of C++, and much prefer the C stdio interface to the filesystem. It's terse, easily read and easy to customise; C++'s iostreams are cumbersome, messy, awkward to configure and hideously complex. And the use of shift operators to do I/O is a ghastly abuse of operator overloading.

I suggest that every C++ at least learn how to use printf, and decide on its merits h(im|er)self.

Not totally true. C is the standard definition of a core set of keywords that perform particular functions. The standard C libraries are just routines that compile under the syntax guidelines for standard C. Without the libraries, you still have C. You can do everything you would be able to do without the standard libraries, it is just a lot more work, and a hell of a lot more complex to code the functions yourself.

I totally agree. I cannot stand using C++'s cout, cin and anything else derived from *stream. I think printf and fprintf (and the slew of other functions) are a hell of alot easier to use, and easier to read in code. I personally think that people who rely on *stream classes don't understand pointers :)

However, recently, I needed an "elegant" method to redirect output to a stream generated by a script engine. The ability to use the << operator to redirect output to a child class was a great boon, and simplified the code a great deal.

>

From a C++ programmer's POV, I find the exact same arguments to hold true

for printf. Hey, I do have one question about this: In C++, you can make an object that refers to a generic I/O type (screen, file, printer, whatever). In all of those cases,

```
   ReceiveObject << data;
```

generates identical output. Is there a way to printf() to a file or other output device without reworking the code? This isn't a smart-alecked question, either - I'm honestly curious.

>And the use of shift operators to do I/O is a ghastly abuse of operator
>overloading.

You've got a point, but then again it could've just as easily been any other operator. And doesn't

```
   stream << outputData;
and
   stream >> inputData;
```

look like data is moving from into and out from the stream? I always thought that was pretty spiffy. :)

>I suggest that every C++ at least learn how to use printf, and decide on
>its merits h(im|er)self.

You're probably right, but I really like the method I've been given, and it seems totally intuitive and comfortable to me. Admittedly, that adds up to little incentive to experiment.

Does anyone know where I can find any docs on the extra functions that Mint supplies? So far, the only ones I've found give little in detail and what is is mostly in the form of a C function prototype. What I

need is a fairly detailed description of each function, including it's function number.

Thanks in advance.

Anyone know where to find the source for M(UN)PACK? I'd like it to add long filename support but can't find it. Alternatively, if anyones got a version that doesn't truncate long names, especially if it works with VFAT...

Thanks in advance.

Greetings all,

In Lattice C 5.6 there are two functions defined in the cookie.h file,
these being - getcookie(), and putcookie().
Both are straight forward to understand and use, but how does one go
about deleting or overwriting an existing cookie? There are no functions
defined for doing this.

I can't see that writing a function to delete a cookie would prove to be
much of a problem, I just don't know how to do it that's all. ;-)

Overwriting an existing cookie with a new value; perhaps putcookie() will
do this anyway? ...hmm, I forgot to check.

Thanks, Karl.

Greetings all,

Under MagiC (4.02 at least), when you change resolution all programmes that use the #_AUT feature in the magx.inf file get loaded again. Now, while this may be of use in some situations, for the password programme I've written this is dammed annoying! Who wants to retype their password each time they change resolution?! Arrggghh irritating!!!

so.....

An idea I've come up with involves putting a cookie into the jar with some magic value to indicate the current rez (i.e: top 16 bits = X; lower 16 bits = Y), if the programme is loaded again it can compare the value in the cookie against the resolution it's being launch in, and if they differ - abort loading.

Does this sound like a suitable way of using the cookie jar? I don't have much in the way of documentation for the rules governing the use of this system feature.

Perhaps there's already a way round my little problem or, there's a serious flaw in my design, but I guess that's why I've posted my message here. ;-)

Thanks, Karl.

The Atari Compendium covers most of the MiNT-spesific functions. You
can also download TOS.HYP if you read German.

You can put anything into the cookie jar you want (after the name that is), but don't expect MagiC to pay any attention to it. If you mean to check the cookie using your own program (after it is loaded, of course) and abort, go ahead. Or you could add an abort button to the password dialog.

A better approach would be write a disk file saving the password and program status when the AP_TERM message is received, then use that file to restore the program when reloaded.

Unfortunately, this introduces a way to bypass the password protection, but shouldn't be a problem if you overwrite then delete the file after you read it. One could also use encryption and/or a time/date stamp to reduce the chance of this file being abused.

Hi,
Does any body know what formats the GNU assembler saves the object file as?
Is it possible to convert them to PureC or DRI compatible somehow, or any other usable format other than GNU's?

Thanks,

Nima

in order of cubase audio 2.0 manual I had do in my atari falcon 030 the
following
suggested modifies for decrease the input audio internal port gain:
I had removed R56; R57; R90; R92; C21; C81;
I had changed R66 and R87 from 100K to 47K
I had put 470 pF in parallel to R67 and R88
I had put 100 pF in parallel to R66 and R87

The audio sensibility of my falcon is now orrible not better of the
original state.

So, I'm looking for the original values, for re-replace it, of the
follow components:

R56 =?
R57 =?
R90 =?
R92 =?
C21 =?
C81 =?

THANK YOU!!!

Look out for TOS.HYP, which is an elaborate ST-Guide hypertext, describing
all of the functions in detail.

Cheers Peter

It's not my task to judge the price, but I think it should be mentioned that
Best Electronics sold those for $60 each at the last Atari fair in Neuss.

Cheers Peter

Yes and No. ;-)

Like Roger said, ideally you should get the stuff you just posted the
next time you connect to the news server.

In practice though, there is usually a delay of a few minutes while
your ISP processes them. This can sometimes rise to a few hours when
they get overloaded or have problems.

If it is consistently taking days for your postings to appear then
that is unacceptable!

Yep, the less the cpu is wasted the more potential there is for a good
game.

>But someone else may throw a second stone and to some
>awfull VDI stuff.

Which is why I referred to Pacman. The vdi could just about manage to
move those sprites around. Anything more complex, and your way is the
best!

>I can't work with the command. I use Pure C 1.0.

Firstly, note that Lattice has a command '_stdargs_' which means
exactly the same thing as cdecl.

Part of the default way for C to call a function is to push the
function arguments right to left onto the stack, but a lot of the time
the arguments are passed in unused machine registers because it is
faster and more efficient. cdecl forces the compiler to use the stack
which makes it possible (but not certain) for one compiler to call
functions compiled by another compiler.

A standard stack frame on the atari looks like this ...

int16

```
foo(int16 a, int32 b, char *c)
{
 a = a;  /* pointless but clear */
 b = b;
 c = c;
 return 0;
}

main()
{int16   r;
 int16   a;
 int32   b;
 char    *c;

 r = foo(a,b,c);
}

main_:
     /push args starting with rightmost one
     move.l   c,-(sp)
     move.l   b,-(sp)
     move.w   a,-(sp)
     jsr  foo_
     adda 10,sp    /pop args
     move.w   d0,r /r=

foo_:
     link a6,0     /typical local stack (empty)
     move.w   8(a6),8(a6)   /a=a
     move.l   10(a6),10(a6) /b=b
     move.l   14(a6),14(a6) /c=c
     clr.w    d0       /return 0
     unlk a6
     rts
```

Assume you are compiling main() but that foo() has been produced by another compiler. If you took 'cdecl' out of the foo() prototype then your compiler is free do optimise the calling code in any way it sees fit. Perhaps like this ...

```
main_:
     move.l   a,d1
     move.l   b,d2
     move.l   c,a0
     jsr  foo_
     /... etc
```

... which obviously totally screws things up for foo()!!

The same thing applies in reverse. If you were writing foo() with the intention of making the compiled function available to other people then you would need to use cdecl in its definition and also in its declaration - ie in the header file you supply to third parties.

Btw, this is much easier to understand than explain. Best thing to do
is try a simple 2 function example like the above with and without all
the combinations of cdecl then trace it with the machine level
debugger.

Yes, for "simple" types such as integers and pointers. Structures and floating point are implementation specific I believe.

int16 Setcolor(int16 index, int16 new)

index palette entry being referenced.
new value to put in entry.

Setcolor() returns the value that was in the entry. If you pass 'new'
as -1 then nothing gets changed but a value is still returned. Thus
setcolor(x,-1) returns the current colour of entry 'x'. Setcolor() is
XBIOS(7) btw.

Btw, you might want to investigate using the VDI. It is more
compatible - iirc Setcolor() has wierd bit ordering due to differences
in the ST/STE palettes etc.

Not too sure on this but I have a vague recollection Degas images have
16 bytes added to the saved file. This is the palette. It's either the
first 16 bytes of the file or the last 16.

>Can anyone help?

Or that might be the Neochrome file format! ;-)

I just had a look myself at the homepage and messe.htm. Out of
curiosity I wondered if the package they'd used had done the same
thing microsoft publisher did to most of my site - it has a habit of
merging text and graphics into one huge image for no apparent reason.
Actually, there is a reason: if two things overlap they get converted
into an image. This new image in turn may then overlap something else
and so on. Trouble is, it's idea of what overlaps and our idea of what
overlaps just ain't the same. It has a good paper-plane making wizard
though ;-) I digress!

It turns out they were done with Netscape Communicator 4.01. This is
one of the "better" editors. After a quick check I discover it is nigh
on impossible *not* to notice this problem, and it is easily fixed.

If someone wants to email them, tell them this ...

Right click on the background image - then "Page Properties-> Page
Colors-> Use custom colors-> Background" and change the bugger from
white to black.

This will ensure if the background image is not loaded the white text
will still be visible. Some redesign is still needed however because
16 colour browsing with that background image enabled is a 'no-no'.

If you want to embarrass them then tell them it's next to the option
for specifying the background image (where it sez words to the effect
of "if background image isn't displayed this will be the background
colour")!! ;-)

PI1 the pallette is at 32000, the pi1 file is actualy 32034, after
the palette is not used, you can poke some ascii charactors in and
sign the pictures or whatever

from my Degas Elite manual:

PI? files
---
1 WORD: resolution Flag
16 WORDS: colour palette
32000 bytes: Picture image data
4 WORDS: left animation limit table (for colour cycling - 4 channels)
4 WORDS: right animation limit table (ditto)
4 WORDS: animation channel direction flags
4 WORDS: animation channel delay

Of course, filling the animation stuff with ASCII wont hurt the picture,
but a display routine that uses it might be interesting. :)

and yes, it does say WORDS - although maybe its wrong... there is a doc
thats been around for years which details all the common ST file formats
(although not many PC) including Degas and Neo.

BTW. I believe Original Degas files (as opposed to Degas Elite) didn't
have the cycling information, and your loader has to cope with this.

Anthony are you saying the pallete for a PI1 is at the front..and not
at 32000? because I always get and put the palette at 32000 and it
always works ?:)

Hehehe... well thats what Tom Hudson, author of Degas said in the manual
- he may well have been lying though. :-)

Tell you what though... STOS "screen" banks are made of 32000bytes of
screen data followed by the palette. Maybe when you use the "load"
command to load a PI1 it fiddles around with it (unless you are
bload'ing them)?

My main point was that its not "unused" data at the end though :)

Is the Compendium still available in print? I don't have a CD-Rom, and my
knowledge of German is almost non-existant.

Among my current projects is a DLL-like manager for the Atari ST family of
computers, from a lowly half megabyte 520ST up to TT030's with dozens of
megabytes of RAM, and Falcons.

I started writing it in 1991/1992, calling it "The Toolbox", and it is now
up to v1.22.

It was written in 68k assembly language, runs in around 32k of RAM, and
requires a 520ST or better computer, running TOS 1.0 or better.

It's almost finished, and ready to go off to beta testers, before being
adopted as an Atari Standard.

Well that's certainly true. I've been planning to do a game in C and
assembly for about a year now. Wouldn't even know where to start. :-)
What I've seen of STOS code (a few years back), it's absolutely perfect for
creating games. And what I've seen of recent STOS games confirms that.

Yep, you'll need some system software either PD or try Syquest, also you
will need an ASCI to SCSI link cable which should set you back about
£30-50 quid which you may still be able to get from Hisoft or the upgrade
shop

But printf is not C. It's no C "command", but a simple library function.
Throw away the library, and printf is gone, but you can still program
in C (however it's more or less a pain).

> Will any code I have written in C be portable then?

No. It's easy to write completely unportable code. But it takes little extra
effort to do the contrary : Code that does not need much change in order to
compile and run on other machines.

> I thought it was due to problems with how the response field to the form

> stores the response in the memory, but I gather now that this is an
> issue with the browser itself?

Yes. The network standards clearly define how such fields must be filled in when transferred across the net. When filled in this way, no problems will arise from this. If violating the standard, then of course you'll get problems, but saying that it's due to the way the PC does something, is a rather lame excuse by the programmer.

> I know I'm being totally thick here, but I was under the impression the
> script excetues on the server, and then essentially collects a response
> in ASCII text from the users machine, but some CGI's also pull across
> IP's etc

That's all alright.

> which can cause problems with Amiga/ST's.

But this isn't. If it does, it's due to bugs in some implementation. Generally it's not easy to determine which one is at fault. The popular way of dealing with this is saying "But millions of machines running Windows work with it", but this is of course silly nonsense, which already has brought us some really devastating problems on the net.

> I think the line limit was 255 characters?

Actually the line limit was 255 tokens, which means each BASIC command took only one single byte (!). So in fact a line could hold up to twice as many commands as was possible even with the shortened commands. However, the only way to enter such a line was manually converting the commands to tokens and enter them byte by byte using the system monitor.

> heh... Funny thing, that no-space thing in the Commodores. What did the ST
> system variable do?

It contained various flags. For instance bit 7 (128) set meant that the last read operation on an opened file ran across an EOF. This made the mentioned problem even worse as testing for a single bit, it's obvious to do such a "ST AND 128" operation which would trigger the problem again if the space was omitted.

Cheers Peter

: However, correct me if I am wrong, that's not legal C.
:
: for(; P("\n") , R- ; P("|"))
:
: R- is not a valid expression.

 You're right about ANSI-C, but I don't know about Traditional C. It
 might actualy be valid for some reason. I've only read about, but never
 actualy used, traditional C.

 The thing that caught my eye is that "u++" thing. I belive the uniary ++
 operator didn't exist until 1989 when ANSI announced standard C.
 Although, I don't know if any C compilers used it before it was a
 standard.

: for(e = C ; e - C);
:
: that for has a ; missing inside the parentheses.
:
: P("_"+(*u++/8)%2)) P("|"+(*u/4)%2);

:
: And surely there's a ; missing before the second P(

 Definitly.

: Please feel free to correct me if I am wrong :-)

 Nope, I think your right. :)

But I seem to remember a limit of 3 lines, even if the left margin was set
to 0 via a POKE command. However, I've not used the system monitor, as I
never went that far.

I seem to remember the 8bits having something like this, somewhere in a
POKE command or somewhere.

>as others should testify.....

That's due to it being Basic, and a lot of people don't think Basic has
the ability to do certain things. They just have to try it, which is
usually all it takes.

What we can use are some documentation and source code samples, like what they have with other platforms, like Unix and Gnus. What is out there right now is just about broke up all over the place, and that makes it harder to find it. Maybe UMich could do something like this, as well as mirrors in other countries. Once that's done, a CD ROM could be burnt, thus helping even more.

>I could take a complete beginer, someone who has never programmed
>before, cut out all the trial and error and pass on the end results in
>a rediculously short period, a complete novice could make the above
>mentioned game in 3 months, anyone who knwos how to use Variables and
>has an understanding of an ATARI screen layout ..half that,

That's just it. Those who haven't really done much programming on the STs, are sometimes having problems due to insufficient documentation on certain areas that they want to program on. There's plenty of books out there on C programming, but just about all of them are for IBM-based stuff. Now, like I said, putting together documentation and source code in some sort of archive can work to an extent.

>Unfortunalty theres a LOT of biased people out there who wont even
>download and try a game simply because of the word STOS, they all
>believe its still in the past :(No matter how I try I cannot get them
>to realise what it can do.....

After seeing Heartland, I must say I'm impressed, after playing with that game for awhile. What can it not do? Seems it's unlimited only by your imagination. How about modem/serial port access?

>So anyway :) I honestly wouldnt have the incentive to do the above for
>one or two people, but if I could get ten people who are determined to
>make a quality game and dont have a pre defined bias towards STOS and
>do have a couple of months then I would do it en bloc

What incentive do you need for just placing it on the internet on a webpage, and allowing everyone to access it? That's more than enough, as you got a whole lotta lurkers who will just rather surf than post. How about other things than games? I'm sure it'll do nicely.

We're talking educational stuff, something that'll challenge your brain cells, as well as allow you to learn.

I'll be adding it to mwc in due course. I'm just amazed I never knew
of it before!

```
>You must not confuse this _appl_yield() with appl_yield(). Latter does the

This one I knew of but also do not know if MagiC implements it or not.
Previously I have simply used evnt_timer(1,0) but will now use
_appl_yield where appropriate. :-)

>In other words you type it in? I do too.

Mostly, but my method can and does vary. My preference is to remove
strain from the compiler and place it on the linker - it makes for
speedier compile/run/debug cycles with mwc. Thus, I have a vast object
library and many tasks simply involve bolting these functions
together. This is just as well because I tend to make the same silly
mistakes over and over again.

Hehe - I seem incapable of typing "make" with any speed. This is why
you will find there is a batchfile called "amke" on my system. This
prints "type make you fool" then proceeds to call "make" anyway!

I think it's been around longer than that, but remember that I proudly
don't know any C and thus can't be considered an expert. Anyway, C++ was
named after that operator, and it's existed for quite some time now.

<BIG SNIP>

  Yes, that is a rather old joke. It's included in 'The Unix-Haters Handbook' by Garfinkel, Weise and Strassmann. This book is a classic and includes such gems as "C++ is to C as lung cancer is to lung". I keep the book by my desk so that I can hit U**x weenies with it when they sneer at us for using OpenVMS systems... The barf bag that comes with the book is attached to the wall above the one U**x machine that we have--it just handles some of our e-mailing.

Hello!

I have a complete Atari 800 system, 810 Disk Drive, Cassette Recorder, etc.
A whole box of cartridges and games. 2 boxes of stuff ready to go.

Everything works.

I prefer not to throw this in a landfill, and I saw these newsgroups.

I live in the greater Boston area, so if you're local come and get it!!

If not, I have no problem shipping this stuff for the COD fee ONLY. I'm
guessing probably around $30 per box for shipping, etc.

Please let me know soon...

I recently moved from a MegaSte to a TT with large screen monitor. I got around to trying to adjust one of my old GFA basic programs to work on the large screen. I found that my version of GFA basic (3.5E) is finicky on the TT. It won't run under MagiC, and while the interpreter will run under TOS, I can't get the compiler/linker to work properly. I see references to a version 3.6. Is this version stable on the TT and can you still get a copy/upgrade somewhere?

 Absoloutly.. hey look at Visual Basic, fourth most sought after
programmer on the pc according to surveys
>
>What we can use are some documentation and source code samples, like what

 Earlier in this thread, while in c.s.a.st i listed these, theres tons
and tons of the stuff and all in one place :)

>right now is just about broke up all over the place, and that makes it
>harder to find it. Maybe UMich could do something like this, as well as

 nope not for stos..like i say..its all on the stos file site... well
maybe that should read "at" not "on"

>>I could take a complete beginer, someone who has never programmed
>>before, cut out all the trial and error and pass on the end results in

>>Unfortunalty theres a LOT of biased people out there who wont even
>>download and try a game simply because of the word STOS, they all

>After seeing Heartland, I must say I'm impressed, after playing with that

 haaa, so thats at least one i converted :))))

>game for awhile. What can it not do? Seems it's unlimited only by your
>imagination. How about modem/serial port access?

no problem, i thought of taking all the baddies out of hero, putting another main charactor in with different clothes and making it a 2 player modem game... death match hero.. the concept of a modem game is quite simple, all you send accross modems are a few variables.... no artwork or sounds.. just variables for each program to know what the other is doing :) but i dont know anyone local to test it on.. far too expensive otherwise..

>>one or two people, but if I could get ten people who are determined to
>>make a quality game and dont have a pre defined bias towards STOS and

>What incentive do you need for just placing it on the internet on a

there are tutorials, guides, articles and even idiot guides and around 15-20 meg of source as well as all the tools needed to do all this, at the one site...

Just check out the STOS FAQ on my STOSSER Pages for the urls and info for the stos file site :)

>We're talking educational stuff, something that'll challenge your brain
>cells, as well as allow you to learn.

beats the hell out of playing games, and twice as addictive :)

```

I think you have all missed the point, if the letter was/is for real then the above line of /code/ is supposed to be giberish. Thats the whole point, that they had made C so complex and full of BS that it would actually accept that line...

Old jokes are often the best, just because many of us here have seen it before does not make it magicaly un-funny...

Yep. I keeps reminding me of Asimov's "Foundation" books, where the
galactic empire stagnates and slowly collapses. When they realise
technology has ground to a halt there's nobody about who knows how it
works or how to fix it.

I had a quick shufty. Er, I dunno! I don't know what I've got in mind
really. That depends on what transpires in the thread etc. Maybe,
maybe not. There - I'm definately sitting on the fence. Well, for now,
I think! <G>

>to realise what it can do.....

Don't tell them! I don't think I've ever mentioned in documentation
what language I write my stuff in.

[tangent mode on]
I was reading a totally unrelated thread in a borland newsgroup a
couple of days back. I forget the exact details but it went something
like this ...

C++ programmer sez to company "yes I can develop your Visual Basic DLL's provided you let me use this new add-on for it that lets you write VB DLL's in C++". Programmer then proceeds to use a C++ compiler.

... and I'm not so sure it was a joke either!
[tangent mode off]

>So anyway :) I honestly wouldnt have the incentive to do the above for
>one or two people, but if I could get ten people who are determined to
>make a quality game and dont have a pre defined bias towards STOS and
>do have a couple of months then I would do it en bloc

That's the problem - not enough bodies!

>If interested then go get Heartland to see what i mean as thats what I
>would teach everyone to make but with your own artwork:) ho and thats
>a couple of yrs old now, I can make it more compatable than it is :)

You're right. STOS does what it does well - and there are more users of it than Mwc! ;-)

:  KaB>: However, correct me if I am wrong, that's not legal C.

: I think you have all missed the point, if the letter was/is for real then the
: above line of /code/ is supposed to be giberish.  Thats the whole point, that
: they had made C so complex and full of BS that it would actually accept that
: line...
```

Bzzzt, and thank you for playing. The line is from a real C program, it has just been mistyped somewhere along its travels (perhaps deliberately, though I would have thought leaving the line as is would have been better). It should be:

```
for(;P("\n"),R--;P("|"))for(e=C;e--;P("_ "+(*u++/8)%2))P("| "+(*u/4)%2);
               ^                  ^     ^                  ^
```

(The ^s mark the differences).

The original letter was published in an April 1st issue of Computerworld (I don't know which year), so it's probably been retyped by hand a few times.

Interestingly enough, I have a copy of the same letter in computer readable form, and the line quoted in my copy is also wrong, but it's wrong in different ways:

```
for(;P("\n"),R=;P("|"))for(e=C;e=;P("_"+(*u++/8)%2))P("| "+(*u/4)%2);
              ^                 ^     ^
```

The program this was taken from was the grand prize winner of the 1985 obfuscated C code competition and was written by Carl Shapiro.

See http://reality.sgi.com/csp/ioccc/ for more truly wonderful examples of C.

- Steven

PS. The Newsgroups line of this thread appears to have been truncated
somewhere along the way, but this is probably a good thing.

The easiest way to test this sort of thing is with two machines locally
and not bother with the modem while testing... How about linking your
ST and PC, and testing with PaCifiST/GEMulator?

The dis-insentive for putting a tutorial such as Tony is suggesting on

a WWW site is that you get (much) less feedback, which would be a key
thing in a project such as this...

 Spot on...Hence the reason I said I would want around 10, that was
just a ball park figure, as the response has been 0 then still doing

it and putting it on a web page has little pull If you see what I mean
:)

GFA Basic only works with a patch under MagiC. I don't know where you can get these patches in the WWW, I only know that I found them on the Face Value Disk and in some german BBS. AFAIK works version 3.6 proper on the TT.

Bye,

Hi!

I'm sorry my reply comes so late, but I didn't have much time in the last days.

Unfortunately, my newsserver does no longer carry the arcticle I wanted to reply to, so I have to start a new thread.

The problem was that redirecting stderr of Pure C compiled programs doesn't seem to work.

After re-checking things (I haven't worked with Pure C's original startup code and libs for a long time), I found the reason: Pure C has - as I already mentioned - stderr's output handle set to -1. This is fixed data in pcstdlib.lib. Therefore, it never does any real output redirection (i.e. Fforce()), but simply always uses handle -1 (CON:) for stderr.

A direct result of this is that you will /never/ be able to redirect stderr of programs linked with Pure C's original startup code and standard lib.

One solution would be to patch pcstdlib.lib (change the -1 for stderr's output handle to 2) and add something like

```
if (isatty(2) && (getenv("STDERR") == NULL))
     Fforce(2, -1);
```

to pcstart.s (of course, in assembler, not C). The getenv()-thing is used because some shells set this variable to indicate stderr is under their control and programs shouldn't call Fforce(2, -1).

A much better approach to solve this problem, though, is to forget about pcstart.o and pcstdlib.lib and switch to the MiNT-lib, as I've been praying before ;)

Ciao

Thomas

That's because you unsubscribed from the STiK developers list ages ago. ;-)
This has been discussed there more than a year ago, and is used now in STinG
in several instances.

Cheers Peter

Hmm... The fourth one? Which are the first three? In one of the AOL
chatrooms I've been in, it's one of the most-used, or so it seems. I've
yet to see anything about C, Pascal, and others.

> Earlier in this thread, while in c.s.a.st i listed these, theres tons
>and tons of the stuff and all in one place :)

I'll look for that message, hoping it's not rolled off my provider's

servers. Mind reposting it? If it's not yet in the FAQ or miniFAQ, it should be. I'll check on it when it's reposted.

> nope not for stos..like i say..its all on the stos file site... well
>maybe that should read "at" not "on"

Have you considered a mirror site? There was mention of a place that had 10 megs of webspace...

> haaa, so thats at least one i converted :))))

heh... I still have yet to read through it. I will admit it's something I didn't give a chance when I first heard about it.

> no problem, i thought of taking all the baddies out of hero, putting

>expensive otherwise..

A Doom clone of sorts, including Rise of the Triad and others, could easily be done. Apogee and id software would be prolly incensed to know we could easily rival their games like that.

Now for a BBS of sorts, or something like CAB and related programs, it could be done.

> there are tutorials, guides, articles and even idiot guides and
>around 15-20 meg of source as well as all the tools needed to do all
>this, at the one site...

How about a mirror site, as I've said before? That way, if one site's unreachable, the other could be.

And yes, I'll be checking the FAQ out. I'm not that big on games, though I play them from time to time.

Unless `R' expands to something like `x-', thus `R-' is parsed as `x--' in
traditional C. Of course, this is invalid in ISO C.

Well, I have got a complete game in C. If you are interested I
can mail you the source code. It has got all the important
routines for handling the keyboard, joystick, screen, colors
and music.

The best way to start is calling Superexec() to get into
supervisor mode (needed when you want to access the hardware
registers.

Bye, Hans

Yes, but then it works only for you own programs, not for other, older
programs, compiled with PureC.

But how do programs which run .ttp programs in a window, like your own tos2gem, work then? Don't they use redirection?

There's no need to change the keyboard interrupt. Simply open a window covering the menu line and you won't be able to get the pull down menu to appear! If you want to temporarily disable the Ctrl-Alt-Tab feature as well you need to set the window update flag to 1. In GFA:
~WIND_UPDATE(1)

Keep in mind that the menu line will not be updated automatically when you close the window. The method described will not disable the Ctrl-Alt-Esc feature though.

How do the present borwsers available for the St react to Java Script?
How compaible are CGI scripts written in C on a PC? Although I have -soe- programming expreience in C++ on a PC, I hve only recently realised my childhood dream (sad, I know) of owning an ST and its been an uphill battle so far...

I know that certain Amgia browsers just crash and freeze when they come across nything like the above, someone told me it wa sdue to how C is compiled on a PC.

Could anyone put me right on this?

C'Mon, Guys! Is this any way to show how friendly BeOS advocates are?

Blaze, In the early '80s, you could have gotten a good answer. Today's

computers are
dangerously complex. I would recommend you look into the "Teach Yourself
<insert language here> in 21 days" books. I found them to start you out
right. As for the language, I see two choices for you:

C

or

C++.

C++ is an extention of C, but because of it's complexity, you may want to
start out with C first.
However, you may not.

Have Fun.

Quite easy : Call the system task scheduler from time to time :

```
_appl_yield:
         move.w    #$c9, d0
         trap      #2
         rts
```

That's all !

Cheers Peter

Ah. I thought you meant something like that.

>(Memory overflows definitely qualify as a bad
>programming practice.)

Most definately. Decent hardware protection does force better
debugging of course. I mean, if the OS kills your program then you
have to do something about it rather than not caring or more likely
never being aware of it.

>g > More importantly, how the heck do you co-operatively multitask

eek! We could be opening a major debate if we go into that one too
much, so we'll agree to differ. ;-)

>Even computationally intense programs
>should show progress on a slide bar and provide an abort option.

True - and also an option for it to be "quiet" on demand.

>OTOH, if your goal is to port UNIX programs with a minimum of
>re-writing, then MiNT is exactly what you want.

Having a command line compiler and MagiC puts me in the middle
somewhat. When I've made global changes to Pug a "make" takes nearly
3/4 of an hour so I set it off in a vt52 window and get on with
something else. This would be pointless with only co-operative
multitasking because make and its compiler phases would hog all the
processor time.

Especially with C. It's so "loose". Given a 10 line program, there's
probably 20 ways of arranging it to do the same job.

>Anyone who remembers will know this is true..

Yep. I remember. It wouldn't be quite so bad with magazine articles
though - and quite welcome in a way. Like politics ... bad publicity
is better than no publicity! <G>

I wouldn't write code more complex than necessary in any case. After
all ...

```
if ((fp=fopen("blah","r")) == NULL)  /* fail */
```

... (which is what I'd normally write) is exactly the same as ...

```
fp = fopen("blah","r");
if (fp == NULL)   /* fail */
```

There's more chance of grasping the latter than the former, so that's
what would appear. If folks wanted to improve it they could by posting
here. If I got flak saying I should have done it differently then
there would be nowt for it but to say "sod off, you didn't volunteer".
[grin]

I dunno. You tell me - they go something like this. Yuck, haven't had to do this for over ten years! ;-)

```
             +---------------+
             |PROGRAM TOLOWER|
             +---------------+
              /        |      \
             /        |        \
                  /         |       \
                 /          |        \
       +--------------+  +-------+   +-----------+
       |INITIALISATION|  |PROCESS|   |TERMINATION|
       |(1)(4)        |  +-------+   |(5)(6)    |
       +--------------+     |       +-----------+
                   |
              +--------+
                   |(C1)(C2)|
                  |PROCESS |
                  | IPCHAR |
              |      * |
                        +--------+
              /    \
                /   \
               /         \
              /           \
     +----------------+ +-----------------+
     |char = uppercase| |char <> uppercase|
     |(2)(3)(4)    @|   |(3)(4)        @|
     +----------------+ +-----------------+
```

* =iteration.
@ =decision.

(1) Open IP & OP files. Zero vars.
(2) Convert to lowercase.
(3) Write IPCHAR

(4) Read IPCHAR
(5) Close IP & OP files.
(6) Write status information.

(C1) Until eof.
(C2) Until error.

One of the rules is all blocks are distinct thus there is no method which allows two blocks to share the same code. If C2 detects a recoverable error it is nigh on impossible to deal with it - you can't just put (6) in another box because that links them.

It doesn't take a genius to realise that this is distinctly Cobol orientated and thus not suitable for a general programming course.

>heh... That'll do it every time. When I was doing my top ten program, for
>some strange reason, I was locking up the computer in one place, forcing

>period, comma, semicolon, bracket, or whatever, that will drive you
>bonkers. Bitflipping was done quite a bit in my program for some strange
>reason, which may have been something to do with Mark Williams C.

Missing out appl_init() in a Gem program can drive you bonkers 'cos it invariably does *nothing* or you might get random crashes. You know what's there MUST work but it's not so easy to spot the code that *isn't* there.

>The problem with doing it all at once, over doing it modularly, is that
>you can introduce bugs all over the program. Do it one piece at a time...
>Some will do it on a 3-shot, and others will take more than one shot. You
>first got the thing in your head, write down the pseudocode, then the
>code, and then go from there onto the computer.

Yeah, that's the crux of the matter - just like in life, each new problem is solved in different ways.

>start of program
>read in data
>sort by logons
>save to disk
>sort by downloads
>save to disk
>sort by uploads
>save to disk
>sort by posts
>save to disk
>end of program

or ;-)

create index arrays for logon, downloads, uploads, posts.
load data
sort by each of the above putting indices into arrays.

save arrays, leaving data unsorted.

Doesn't matter which method gets used when you're a lone programmer.
It's when you have to work in a team that things get complex.

Good for you.

>and its been an uphill
>battle so far...

Stick with it. Unlike the PC where it's a constant uphill struggle,
once you've learnt a few things it remains easy. That knowledge works
in reverse also, and you'll gain a greater understanding of what the
PC is doing, why it isn't working, how to fix it, and most importantly
what ought to be disabled and why. ;-)

>I know that certain Amgia browsers just crash and freeze when they come

Does that work without appl_init() etc?

ie:

```
main()
{
 for (;;) _appl_yield();
}
```

wouldn't hang the system?

Just my 2 cents: it's probably easier to start with C, but when you switch
to C++ you could get a bias towards "making things the C way" which is
often less efficient than using the C++ way. I didn't entirely get over
such bias myself...

That's not so hard. It doesn't use floating points. :-)
My version of GCC would compile hello.c without to much problems,
but apparently it assumes I have an FPU (even if I use -msoft_float
or whatever the thing's called), so most UNIX sources go pop.

THE STORY OF CREATION
or
THE MYTH OF URK

In the beginning there was data. The data was without form and null,
and darkness was upon the face of the console; and the Spirit of IBM
was moving over the face of the market. And DEC said, "Let there be
registers"; and there were registers. And DEC saw that they carried;
and DEC separated the data from the instructions. DEC called the data
Stack, and the instructions they called Code. And there was evening
and there was morning, one interrupt ...

>I dunno. You tell me - they go something like this. Yuck, haven't had
>to do this for over ten years! ;-)

Yep... That looks quite similar to the usual diagramming I used to do, but somewhat different. That's more of a top-down style of programming, where you do the main part, and go from there.

>It doesn't take a genius to realise that this is distinctly Cobol
>orientated and thus not suitable for a general programming course.

That's it, yes. I've done Cobol programming, and I know what a well-written program looks like. However, you need to add on the remarks, so when you come back to it some time later, you will remember what you were doing. I had this class, and I did this one program that was distinctly different than everyone else, in the way that I used arrays and that kind of thing, that wasn't taught yet. That was due to my having a class some years ago, and it was coming back to me. The kicker is that I was always one programming assignment ahead.

One must remember that C and Cobol are quite different. But jeez... Try some complex calculations on it. MULTIPLY this TO this, DIVIDE this, ADD this TO this, and so on. Yeek... I watched one person have a screenload of these calculations at one point. I gotta dig out my Cobol books for maybe a short demo here, but then again, it'll be too damned long.

Remember the TRS-80? I learned to program Basic on there. It had a weird ability of these edit commands, and if you edited a line too often, it would seemingly error out that line. One particular line had TAB Y that

read as TABY, which was normal, and the system would add the space. In this case, it didn't. Drove some of us in this high school class bonkers til I and another student figured it out before the teacher did.

>Missing out appl_init() in a Gem program can drive you bonkers 'cos it
>invariably does *nothing* or you might get random crashes. You know
>what's there MUST work but it's not so easy to spot the code that
>*isn't* there.

Hmm... I don't have the manual with me, otherwise I'd know what appl_init() does. Adding little echo lines that will tell you where the program is can help. I don't like running a program and it doesn't say what it's doing. That's why I said do it modularly, do it in parts, and test them as you go.

>Yeah, that's the crux of the matter - just like in life, each new
>problem is solved in different ways.

A class of 20 people will get a program written 20 different ways.

>create index arrays for logon, downloads, uploads, posts.
>load data
>sort by each of the above putting indices into arrays.
>save arrays, leaving data unsorted.

You got it. What I did earlier was merely the beginning. That above was similar to the next thing I did. I can't find the notebook I used for my notes when I was writing that program, otherwise I'd be posting some of those notes here. [sigh]

>Doesn't matter which method gets used when you're a lone programmer.
>It's when you have to work in a team that things get complex.

I did it before. Thus, the argument of "it works for me" can easily get you in a lot of trouble, like getting yelled at, kicked off the team, or worse, fired. Program exchanges in teams aren't uncommon.

Aha! I will check it out.

Yup, MagiC has got something called:

```
void init_scrlted(OBJECT *o, WORD is_scroll, XTED *xted,
                  char *txt, char *tmplt, WORD len);
```

But I don't know where this function is defined. It will also only work
with MagiC
as I don't think N.AES supports it. Maybe next release of N.AES will
support
some of MagiC functions?

Visit http://operasoftware.com/alt_os.html

or email magic@operasoftware.com

and tell them we want a browser for the Atari ST.

At the moment they produce browsers for PC, Mac and are adding Amiga!
If we send them enough emails they may support the Atari ST, but only if
they get the interest, so get emailing now .....

John.

We tried to get Operasoftware to support the
TOS/GEM computers ... but they claimed they
were "...only five programmers..." and that
they needed to support "...live platforms...".

Although they expressed interest in the
available pre-emptive multi-tasking OSes
(MultiTOS et. al.) that run on the TT/Falcon,
they have decided to bide their time.

Be patient ... and remember we have WenSuite
and CAB already available.

Actually, I've taken C++ in college, and don't know a thing about C. To be
honest, after looking at some old C source, I'm rather happy about that. :)

?? CGI executables are run by the web server, on the web server machine.
There is no compatibility issue.

If you mean porting a CGI executable in C from a PC to a web server running

on Atari (for instance Olivier's excellent SHTTPD), this is as easy or as
difficult as porting any C source to Atari. If the code is written well,
you need to do very little, just recompile it.

> I know that certain Amgia browsers just crash and freeze when they come
> across nything like the above, someone told me it wa sdue to how C is
> compiled on a PC.

Nope. That's got nothing to do with CGI. I'd say simply bugs.

Cheers Peter

Ok, that makes sense. I wasn't aware (C++ newbie) that you could port C code across... the eventual idea is to use an ST as a server simply for the purpose of running CGI scripts off as my present ISP dosen't allow that.

Will any code I have written in C be portable then?
>> I know that certain Amgia browsers just crash and freeze when they come
>> across nything like the above, someone told me it wa sdue to how C is
>> compiled on a PC.
>

Hmm. Again, newbie confusion here probably on my part :)

I thought it was due to problems with how the response field to the form stores the response in the memory, but I gather now that this is an issue with the browser itself?
I know I'm being totally thick here, but I was under the impression the script excetues on the server, and then essentially collects a response in ASCII text from the users machine, but some CGI's also pull across IP's etc which can cause problems with Amiga/ST's. I think I'm beginning to be horribley wrong at this point...

(Incidently I disappeared into the realms of Java to try this, with -some- success)

>Cheers Peter

Thanks for putting up with my annoying questions/general
dribble/confusion.

There seem to be 'experts' only in this field and I am very much the
bumbling beginner at present...

Remember Commodore BASIC ? You did not need to care about space anywhere.
That's until you did an anded if construct involving the system variable
ST :
10 IFSTANDA=BTHEN something
so you would expect it to convert automatically to
10 IF ST AND A=B THEN something
Instead it did
10 IF S TAN DA=B THEN something
which of course results in a SYNTAX ERROR. Drives you crazy.

Cheers Peter

> Does that work without appl_init() etc?
```

Yes. You'll note from the opcode that this call is GEM but neither VDI nor AES, correspondingly no parameter arrays are needed. It is available in all TOS versions. It's the function AES calls internally to do the multi-tasking.

You must not confuse this _appl_yield() with appl_yield(). Latter does the same, but is a true AES function which also needs the AES parameter arrays. AFAIK it's available only in PC-GEM.

Cheers Peter

Yeah, have you seen this?

----8<-----8<-----8<-----8<----

CREATORS ADMIT UNIX, C "AN ELABORATE PRANK"

In an announcement that has stunned the computer industry, Ken Thompson, Dennis Ritchie and Brian Kernighan admitted that the Unix operating system and C programming language created by them is an elaborate prank kept alive for over 20 years.

Speaking at the recent UnixWorld Software Development Form, Thompson revealed the following:

"In 1969, AT&T had just terminated their work with GE/Honeywell/AT&T Multics project. Brian and I had started work with an early release of Pascal from

Professor Nichlaus Wirth's ETH labs in Switzerland and we were impressed with its elegant simplicity and power.

Dennis had just finished reading `Bored of the Rings', a National Lampoon parody of the Tolkien's `Lord of the Rings' trilogy. As a lark, we decided to do parodies of the Multics environment and Pascal. Dennis and I were responsible for the operating environment. We look at Multics and designed the new OS to be as complex and cryptic as possible to maximise casual users' frustration levels calling it Unix as a parody of Multics, as well as other more risque allusions.

We sold the terse command language to novitiates by telling them that it saved typing.

Then Dennis and Brian worked on a warped version of Pascal, called `A'. `A'looked a lot like PAscal, but elevated the notion of the direct memory address (which Wirth had banished) to the central concept of the language.

This was Dennis's contribution, and he in fact coined the term "pointer" as a innocuous sounding name for a truly malevolent construct. Brian must be credited with the idea of having absolutely no standard I/O specification; this ensured that at least 50% of the typical commercial program would have to be re- coded when changing hardware platforms.

Brian was also responsible for pitching this lack of I/O as a feature; it allowed us to describe the language as "truly portable".

When we found others were actually creating real programs with A, we removed compulsory type-checking on function arguments. Later, we added a notion we called "casting"; this allowed the programmer to treat an integer as though it were a 50kb user-defined structure.

When we found that some programmers were simply not using pointers, we eliminated the ability to pass structures to functions, enforcing their use in even the simplest applications. We sold this, andmany other features, as enhancements to the efficiency of the language. In this way, our prank evolved into B, BCPL and finally C.

We stopped when we got a clean compile on the following syntax

```
for(;P("\n"),R-;P("|"))for(e=C;e-C);P("_"+(*u++/8)%2))P("|"+(*u/4)%2);
```

At one time, we joked about selling this to the Soviets to set their computer science progress back 20 or more years.

Unfortunately, AT&T and other US corporations actually began using Unix and C. We decided we'd better keep mum, assuming it was just a passing phase. In fact, it's taken US companies over 20 years to develop enough expertise to generate useful applications using this 1960's technological parody.

We are impressed with the tenacity of the general Unix and C programmer. In fact, Brian, Dennis and I have never ourselves attempted to write a commercial application in this environment. We feel really guilty about the chaos, confusion and truly awesome programming projects that have resulted from

our silly prank so long ago.

Dennis Ritchie said: "What really tore it (just when AIDA was catching on), was that Bjarne Stroustrup caught onto our joke. He extended it to further parody Smalltalk. Like us, he was caught by surprise when nobody laughed. So he added multiple inheritance, virtual base classes, and later... templates. All to no avail.

So we now have compilers that can compile 100,000 lines per second, but need to process a header file for 25 minutes before they get to the meat of `Hello World'."

Major Unix and C vendors and customers, including AT&T, Microsoft, Hewlett-Packard, GTE, NCR, and DEC have refused comment at this time.

Borland International, a leading vendor of object-oriented tools, including the popular Turbo Pascal and Borland C++, stated they had suspected this for a couple of years. In fact, the notoriously late Quattro Pro for Windows was originally written in C++.

Phillipe Kahn said: "After two and a half years programming, and massive programmer burn-outs, we re-coded the whole thing in Turbo Pascal in three months. I think it's fair to say that Turbo Pascal saved our bacon".

Another Borland spokesman said that they would continue to enhance their Pascal products and halt further efforts to develop C/C++.

Professor Wirth of the ETH Institute and father of the Pascal, Modula 2 and Oberon structured languages, cryptically said "P.T.Barnum was right." He had no further comments."

I never did program on the Commodores, though I did read some and modify a
few. The 8bits had the ability, as you know by now, to shorten the
commands, to get more bang for your line limitations.

I think the line limit was 255 characters? Most of us had seen one going
way beyond that using that command shortening trick. One particular
program drove me bonkers til I figured out that I was actually cutting off
a part of a line by my forgetting to shorten the commands. Then once I
made a backup of this particular line by putting a REM in front of it.

heh... Funny thing, that no-space thing in the Commodores. What did the ST
system variable do?

Maybe he saw an old K&R C source. That's not so nice when you
are used to ANSI C. C++ should be backward compatible to ANSI C,
there are some minor differences.

Bye, Hans

Hey! rsg0910@iglou.com (Robert Goodwin) wasn't it Thu, 29 Jan 1998
08:27:12 GMT that you wrote:

>>there so few potential new programmers left to make it unworthwhile?

>and a bunch of others. It's still worthwhile. We just pass it on to the
>new programmers who will then pass it on as well.

OK heres a thought I have been kicking around for ages...but?

I know most people have a downer on STOS, But the fact is I can make a
fast 8 way scrolling platform game that would rival Sonic, and it will
work on anything from a one meg FM through STe. megas, TT's and
Falcons with afterburner and nemesis, this isnt showing off, its been
done, No one needs fix or do anything special, just run your TT
,Falcon or bog standard ST and the game plays..and its smooth and fast
as others should testify.....

Now its taken quite a few years with a hell of a lot of trial and
error :(and new add ons being made to get to the point where the
above can be done, Most of the time taken up with experimenting..

I could take a complete beginer, someone who has never programmed
before, cut out all the trial and error and pass on the end results in
a rediculously short period, a complete novice could make the above
mentioned game in 3 months, anyone who knwos how to use Variables and
has an understanding of an ATARI screen layout ..half that,

Unfortunalty theres a LOT of biased people out there who wont even
download and try a game simply because of the word STOS, they all
believe its still in the past :(No matter how I try I cannot get them
to realise what it can do.....

So anyway :) I honestly wouldnt have the incentive to do the above for

one or two people, but if I could get ten people who are determined to
make a quality game and dont have a pre defined bias towards STOS and
do have a couple of months then I would do it en bloc

If interested then go get Heartland to see what i mean as thats what I
would teach everyone to make but with your own artwork:) ho and thats
a couple of yrs old now, I can make it more compatable than it is :)

.-- Cheers !ynoT ----- Tony Greenwood (ATARI Programmer) --

Mark Ormerod (atari@valeofdreams-dot-demon-dot-co-dot.uk) wrote:

: Will any code I have written in C be portable then?

Depends on how portable you make the code (see below).

: >> I know that certain Amgia browsers just crash and freeze when they come
: >> across nything like the above, someone told me it wa sdue to how C is
: >> compiled on a PC.

: I thought it was due to problems with how the response field to the form
: stores the response in the memory,

This could be the case if the code you're trying to compile
assumes a little-endian machine (ie. an architecture that uses
byte-swapped words, like all Intel-based PC's).
It is always bad for portablibity if a program (especially an
Internet-related program!) assumes a certain byte-order.
However, as most socket-related programs (should) use a call to swap
bytes from network order (big endian, as on Atari/Amiga/most other sane

machines) to machine order and back, the above situation seems highly
unlikely. Unless the code was written to be used on PC's _only_.

: I know I'm being totally thick here, but I was under the impression the
: script excetues on the server,

Correct.

: and then essentially collects a response
: in ASCII text from the users machine,

Which souldn't cause any compatibility problems.

: but some CGI's also pull across
: IP's etc which can cause problems with Amiga/ST's.

It shouldn't, as CGI's are _supposed_ to be able to run from any server,
big-endian or little-endian... (Note that compilation might cause
some problems on Atari with missing library calls. You should use
GCC, MiNTLibs and the MiNTNet portlib for best compatibility with
most UNIX-oid programs)

: I think I'm beginning
: to be horribley wrong at this point...

Don't be to sure about that...

: (Incidently I disappeared into the realms of Java to try this, with -
: some- success)

JAVA hasn't got (or shouldn't have) any of the compatibility issues
mentioned above, as it's a higher language than C and better suited for
networking.

: Thanks for putting up with my annoying questions/general
: dribble/confusion.

That's what newsgroups are for. :)

: There seem to be 'experts' only in this field and I am very much the
: bumbling beginner at present...

Don't count on it. Messing around with CGI's, JAVA and stuff means
that you're probably more of an expert on these maters than most of us
Atarians here... I myself only know about porting the stuff to Atari,
and the problems that come with it. And as for JAVA, I only know
what I just learned in a first-year AI course on Java-programming,
which was still a bit, er, primitive :) (Things like: Write a program
that will print all names in this text file in a slightly more
formatted manner. Use variables and methods. Oooh.)
I prefer assembly hacking. :-)

Well, I'm not *totally* ignorant about C; I mean, punctuation and the basic
structure is about the same. However, we took the object-oriented approach
(data streams, templates, new/delete vs. allocmem/freemem, etc.), and I
can proudly say that I have absolutely no idea how printf works.

My mistake, I checked and the ones which cause problems involve annoying microsoft bits. Some frontpage extensions can cause this apparently. Not that I go anywhere near that sort of thing...

Provided I'm using a UNIX compiler I should be fine is that right?

Hmm. It'll just be ignored, unless I drop a cookie down into the machine which should get around the problem. Any idea how the ST browers 'report' themselves to the server to which they are connecting?

<SNIP>

Never had the patience or dedication for assemly when I was young, something I'd like to get onto eventually when I've cracked C I think.

JAVA itself seems fairly basic, may be possible to bodge a port to the
ST regarding the bits I want to use, as it is essentially a derivitive
from C (again correct me if I'm wrong) so I -should- be able to just
concentrate on the bits I'm interested in - ?

>

```
> for(;P("\n"),R-;P("|"))for(e=C;e-C);P("_"+(*u++/8)%2))P("|"+(*u/4)%2);
```

However, correct me if I am wrong, that's not legal C.

```
for( ; P("\n") , R- ; P("|") )
```

R- is not a valid expression.

```
for( e = C ; e - C );
```

that for has a ; missing inside the parentheses.

```
P("_"+(*u++/8)%2)) P("|"+(*u/4)%2);
```

And surely there's a ; missing before the second P(

Please feel free to correct me if I am wrong :-)

RENUM would work, but it would totally break your programs if you didn't go through it to change the GOTOs and GOSUBs. However, if you numbered your lines by increments of 10, 20, or more, you were fine, unless a certain block would require a lot of changes.

>I preferred BBC-Basic. Had a bit more structure in it...

There were various flavors of Basic out there. I used the Microsoft Basic for the 8bits for a little time, as it was quite similar to TRS-80 Basic. I never quite got the hang of the TRS-80's DFDBL and related commands. However, there was this one program called Empire that always lost me for hours on end.

>What I miss most about those old machines is a decent editor.

heh... Yep... The built-in full-screen editors were the best.

>Although having to retype a line every time you wanted to change something
>does increase your typing skils in the long run. :)
>I guess that's the downside of the BBC Micro's "copy" key. ;-)

How do you think most of us have good typing skills? My 400 required me to tap a little more harder than a normal typewriter. Get this... The first typewriter I had had some metal, with the keys themselves made of plastic. It was a wonder they didn't break.

Then again, just using those CTRL-arrow keys did make at times, whether you were programming or not, for a nice demo of cursor aerobics. [hehe]

Well I have got them. but you also need to look in them to find out. :-)
As they are in german you often tend to only look at them when it's
absolutely necessary. Then if you are lucky you find what you want. In
this case it was rather easy. :-)

I remember a section in an Amstrad magazine I used to read at the time, where
the game was to write the most sophisticated program in 10 lines of basic.

You should have seen some of them were pretty impressive. I remember seeing
word processors, disk editors, a few demos, and some pretty cool games too.

Cheers,

Nick.

If you're a lone programmer then do everything in hex if you like. If you work in a team the situation is totally different. Personally I have adapted the formal methods of programming for my personal projects as well, as I find them much more efficient when I do something a bit bigger than a 5K utility.

Hi !
I'm quite new to this list and not sure if this question fits (sorry).
I've just started assembler programing the Motorola 68000 and as far as I
know this is what's inside an Atari.
Is it possible to program my Atari with any assembler instead of emulating
the processor and memmory on my PC. It sure would be mor fun to do it for
real.

Niels

Hi!

In article <34d6ebf86db1d1@xs4all.nl>,
     josdb@xs4all.nl (Jos den Bekker) writes:
> Yes, but then it works only for you own programs, not for other, older
> programs, compiled with PureC.

True, but you may patch them, too. It's a bit more tricky, but possible.
Of course, there's no clean way without patching or catching vectors.

> But how do programs which run .ttp programs in a window, like your own
> tos2gem, work then? Don't they use redirection?

TOS2GEM (and most other solutions to run TOS/TTP in GEM windows under
SingleTOS) don't use GEMDOS output redirection, but catch either the
BIOS vector for Bconout() or the special vectors xconout & Co. That's
why they get /all/ BIOS-output which would normally go to the screen.
That's the reason why TOS2GEM is an Auto-folder program, and not just a
desk accessory or something like that.

Without catching the vectors, these tools wouldn't be able to display
any output of the TOS programs before they are finished, as SingleTOS is
not multitasking. With MiNT, that's a different story. Here you can use
pseudy-TTYs and output redirection. Maybe that Pure C-problem is one of
the reasons why MiNT also allows redirection of the negative
non-standard handles, i.e. -1 for CON:, as otherwise for example TOSWIN
wouldn't be able to catch stderr of these programs, either.

Ciao

Thomas

Hmm. Looks like I never got it. I'd better take this to email. ;-)

Not at all. It's a common Gem problem and it just so happens that there is no particularly easy method to do it, especially in a window. It is possibly the weakest part of Gem that it supplies no function to do this at a reasonable level.

There is a way to cheat in some circumstances though. Provided speed is not an issue (a line by line scroll will be dog slow) and only the system font is required, you can create a fixed sized text window using a resource editor. Use some G_STRING objects on top of a white G_BOX and copy the text into them. The redraw code is exactly the same as for any OBJECT tree in a window - just walk the rectangle list calling objc_draw().

It's a complete bodge but it does allow you to concentrate on very much less at once, like adding the code for various messages one at a time (dealing with a WM_MOVED message is simply a case of setting the ROOT object position to the new window work area for instance).

From there you can gradually remove the "tree", the next step would be to hide the G_STRING objects and use v_gtext() to produce the same output (actually I'd recommend leaving the G_STRING's visible and slapping the v_gtext() output over the top (XOR mode or just a different colour) as this will highlight small differences the eye fails to notice).

Gee Tony, I was just trying to avoid getting into yet another
wrangling match over STOS versus C - and there you go getting all
defensive! :-))

>whats that all about then ?

Simply trying to avoid implying the reverse which I seem to have
managed to do anyway. That certainly would have bought you out with
all guns blazing!!! ;-)))

Good gracious me, yes, Niels. You don't want to be messing around with
PCs, :-)

The Devpac assembler is good but commercial.

You can now find the Turbo assembler PD.

The advantage of Devpak is that it comes with a decent manual which
documents the Atari system calls (Traps).

Well it reads that STOS is limited to itself, that it can only manage
certain things..where I concede that all languages have there
limitations I have never seen you use anything simmilar, would you
finish off a paragraph with "well C does what it does well" implying
whatever?...go on admit it you wouldn't.. thus using it to describe
STOS means you think less of it....

<FX:SLAP> Choose your weapon sir....

DICLAIMER My above posting is a JOKE in response to insinuations that
I like STOS.....get happy:)

:-))) Well maybe it's a mixture of swedish and german, some kind of
methamorphosis. In swedish it should read "under konstruktion". They
just replaced the "d" with a "t"....

Never mind. :-)

BTW. I'm still waiting for a url with: www.magic.com

Doesn't work yet. :-)

This is not as bad as you say here. Even with this you can make work at
a fairly decent speed, although I agree v_gtext() is faster. Actually
quite a few programs use this scheme, for instance STinG's Dialer : the
TraceRoute tool.

Cheers Peter

Hi everyone,

     I'm looking for a work processor shareware/freeware which allows
the usage of GDOS fonts. I got wordplus, but that only allows fonts
designed specifically for that program. I got Marcel but can't seem to

find how the fonts are selected for using on the editing page. And I've
got EDITH. Edith seems to be the best, however I can't seem to use
different fonts within the one document. Such as the title being SWISS in
24 point size, and the topic headings being another while still being
able to use the normal size fonts for normal text. It seems whenever you
select a font, the whole document reformats itself to that font. Are
there any word processors out there that allow the usage of different
fonts within one document, and if so where?

Scott.

that's because it's a text editor, not a word processor.

I don't know of any freeware or shareware WPs that allow that. Most commercial
ones will work fine though.

Cheers,

Nick.

You can find the patches you need at my page:

http://home.sol.no/~veg/gfa.html

(a lot of other useful GFA-stuff can be found there as well)

Hello,

After I offered the C sources of a game to Levien van Zon, I
got multiple requests for a copy of the source. Maybe I should
give a short course in how to program a game in C? I was
thinking about writing a Pacman game as an example of C (and
combined C and assembley) game coding.

I will use the Pure C compiler. Most of the code will be
ANSI C but because I will do some low level programming there
will be some implementation specific issues too. So I can not
guarantee it will directly work on other C compilers (esp. the
assembley parts).

Let me hear form you (in this newsgroup or by e-mail) if you
are interested.

Bye, Hans

Check out Falclib - this has window (including windowed dialogue) routines in assembler.

If you want information about AES 4.1 toolbars, AFAIK there isn't any assembler source code for this about - however you can find details about how to do it on my WWW pages (check the .sig for address).

C is extremely easy to learn Tony, so I wouldn't worry about that.

The ST models yes. The Falcon, TT etc have more advanced 680x0
processors but they all run 68000 code in any case.

Yes. I'll leave the recommendations as to which assemblers to use (and
where to get them) to someone more qualified in this area though!

Agreed. However, I would be surprised indeed if text rendering are as
basic as it is for Gem.

It can be when you have a large "window" and scroll by single lines.
Then again, this method shouldn't be used in that case. ;-)

>are interested.

I think it is a good idea! <G>

A Pacman game would not use too many resources so you might consider
"killing two birds with one stone", and implementing it using VDI
calls. I should be able to dig out some useful sources for that if you
want.

Feel free to ignore my suggestion. It is more important you are
prepared to do it, than how you do it. ;-)

Nope, I wouldn't. I'd have to say the opposite! It can easily be
argued C does what it does too well! There's always one more way to
accomplish exactly the same thing. Worse than that, it would be more
correct to say there's (in practice) always one more way to accomplish
nearly the same thing. This can make it extremely difficult to be able
to follow third party sources.

>thus using it to describe
>STOS means you think less of it....

If we were sat in a pub this exchange would take a couple of minutes
'cos we could use all those "ah yes", "hmm", and body language
doofreys that would tell us both we weren't really on opposite sides
of the fence in this particular context!! ;-))

> <FX:SLAP> Choose your weapon sir....

I only think less of it because it it difficult to do anything with it
that it has not been designed to do. In the same manner, I think less
of any language that is subject to the same restrictions. What STOS
has got in its favour, is unlike "those languages", it can do some
things very well, which promptly raises it back out of that catagory!

That's what I meant when I said it does what it does well! :-)))

 It was designed for game making, but look at all the diskzine
shells?, more diskzines use STOS shells than any other, Even ST Format
said STOS would be the best language to use to make a Multimedia
authoring package...so I did :) I have STOS written sector editors,
virus checkers/destroyers and all manner of serious routines, The only
limit to STOS is peoples imagination...hmm where did I hear that
before? :))

>of any language that is subject to the same restrictions. What STOS

 No restrictions here mate? :)

Hi Niels,

> Is it possible to program my Atari with any assembler instead of
> emulating the processor and memmory on my PC. It sure would be mor fun
> to do it for real.

There are quite a few freeware/shareware assemblers about for the ST. Devpac 1 from Hisoft is the only when with a GEM front end I believe, but the best in terms of functionality is probably the GNU version.

By far the best commercial assembler is Devpac 3 this will allow you to assemble code for processors inside all Atari computers. Get this second hand if you can.

John.

GEM and Assembly Language are two things that don't go together easily.

To be absolutely honest, I doubt you would understand the source code without understanding the mechanisms first. Windows are the worst of all and can be problematic at best even in C. I suggest you read; 'The ST Assembly Language Workshop Vol II' by Clayton Walnum and the ProGEM series by Tim Oren. Both are published in electronic form and are shareware and freeware respectively. You can find them in most Atari archives.

Good luck.

John.

Hello, can anyone give me an explanation of the command 'cdecl' in pure C???
I can't work with the command. I use Pure C 1.0.

Does anyone know where I can get the latest version of Pure C (V1.1??)???

Yeah, lets go for it. If you want a Pac-Man game in GEM written
completely in C, take a look at my webpage. ;-)

It's not very good, but it sort of works. Maybe I should try to
finish it someday. It has got a few nasty bugs.... also I havn't
got a clue on how fast it is on regular Falcons or STs (if it works
at all on them).

Anyway, I think it would be a great idea.

They are? I looked at them today and I think they look quite nice. There
are a few glitches but they look much better than most pages I have seen
before. They are also under construction. so don't judge them to early.

> It's been the first time that I've seen somebody using white text on a
> white background (!) It's ridiculous.

Where did you find this? On your own pages? ;-)
Seriously I couldn't find this anywhere at all. Tell me where?
BTW. Background colours looks to be something that they havn't masterd
at all. Maybe it's a limitation in the webdesign program they use.

I realy think we should see this as a postive thing as it's not realy
often you see someone making a serious try on making something useable
for Atari users. Look at Wizztronics web pages. They are pathetic and
looks like a bunch of kids have knocked them togheter in 5 minutes.
And these guys are our future? Bha!

If I would bet a penny on any company it would be FALKE Verlag and Milan
GBH. Atleast they try to be professional and for that they should get
or respect.

Well, here I was rambling again... :-)

De Meester wrote:

> Hello, can anyone give me an explanation of the command 'cdecl' in pure C???
> I can't work with the command. I use Pure C 1.0.

It is used in function definitions to force the compiler
to put (and get) parameters to that function over the stack.

Example:

```
int add(int a1, int a2)
{
  return a1+a2;
}
```

The compiler will put the arguments a1 and a2 in the registers D0
and D1. The answer will be in D0.

but with

```
int cdecl add(int a1, int a2)
{
  return a1+a2;
}
```

the compiler will put the parameters a1 and a2 on the stack and
de function will put the anser on the stack.

Normally Pure C uses D0-D2 for the first 3 integer type parameters
and A0-A1 for the first 2 pointer type parameters.

VDI? That's defenitly not my way. I will go directly to
the hardware, bypassing the OS as much as possible. The
price you have to pay is compatibility (the game won't
work on the Hades, Medusa, Milan and all other clones
using a PC graphics card), the thing you win is speed.

But someone else may throw a second stone and to some
awfull VDI stuff.

You have to know at least how to compile "hello world!". I think
there will be a lot of 'black magic' for beginning C coders and
people who never got to the hardware level. They will have to use
those functions like black boxes, just knowing what they do.
Other people will understand those functions and be able to
modify them to their purposes.

But it won't be a beginners course C. You'll have to dive
into the deep to learn swimming this way?

I would go for Turbo Assembler. It's fast, has an syntax checking
editor and a very good debugger (bugaboo). It's a freeware program.
The current version is 1.77, I think.

What is this reason ? I couldn't find any hints.

BASIC or not, Atari or Acorn or Apple2, Amiga, a BeBox or Mac (note the guy posted to all corresponding newsgroups), the original message contained such ridiculously little information, there is little else you can do but putting fun at it.

What if he wants to use Smalltalk on a Acorn RISC machine to program a midi sequencer ? I never saw such machines apart from pics in magazines, I never even saw Smalltalk code apart from a few teaching examples, and I won't even know how to use a midi sequencer.

I'd happily help him with what I know, but there are more than a thousand programming languages, so he should be a little more specific.

Cheers Peter

In the language department, it says BASIC programmming in the subjet!

Hi there,

  [blago1@yahoo.com (Blaze)]
 > I am just staring out in programming and would appreciate some
 > pointers

Get a good tutorial for your chosen language be it a book or a document from the net. There is a great deal of free information and source code out there especially for C. I would recommend that you download as much of this as possible and study it, look at how other people have solved problems and use them or look to improve them.

Learning the the basics of a language will be fairly simple, the difficulty will come in using this knowledge to best effect in practicle situations. It is going to be no easy task and you will make lots of mistakes
and expect to crash your computer many times. Do make best use of newsgroups like this and don't be afraid to ask about things you don't understand however trivial it may seem, but do be specific about your problem and make sure you provide all the relevent details otherwise people can only guess at the solution.

There is of course no substitute for experience and with time and effort I'm sure you'll become a competent programmer.

Good luck.

John.

 I agree, I just went into this thread, saw 12 responses and NO help,I
thought that to be a little strange, it wasn't until I investigated
the header and thought ?... well how silly :)

> yield 1.

If you know it better, why do you ask at all? If you take a look at the
Pure C standard lib, you'll see that stdin, stdout, and stderr have
hardcoded fileno()-results, and stderr will yield -1 because PC's startup
always calls Fforce(2, -1). If that's a good idea is a different
question, but you shouldn't be using PC's standard libs for console-like
programs, anyway. Use the MiNT-lib.

>>Fforce(-1, something) can't work, as the first handle has to be a standard
>>handle, i.e. 0 <= handle < 6.
>
> Not entirely true. See below.

If MiNT makes this possible, it's not conforming to what the original
GEMDOS docs say about Fforce(). oldhandle has to be a standard handle,
and that means 0 <= oldhandle < 6. The negative handles are no standard
handles, but point to directly to the BIOS devices for CON:, PRN: and
AUX: (Fcreate("CON:") also returns -1, btw.)

>>That's why you should either redirect GEMDOS

>>handle 2 directly
>
> Yes, but that's the point. It doesn't work.

Yes, after re-checking the standard libs of PC again, I noticed that stderr is hardcoded to -1 (see above). So you'd either have to manipulate stderr's output handle by directly changing its associated GEMDOS handle (not recommended, as it's highly unportable and bad style, anyway), or switch to the MiNT-lib (strongly recommended).

>>It's not a good idea anyway to mix
>>library calls (i.e. fileno()) and direct GEMDOS calls it not absolutely
>>necessary.
>
> I fail to see why. Of course, you must know what you're doing, and it
> doesn't hurt to know what exactly the library functions do...

It's not a good idea to mix library and GEMDOS calls to achieve something as it makes programs unportable, sometimes even between different ATARI C compilers. And, as a general rule, one should always use the highest abstraction level possible.

> I don't have dup2 with PureC, but if you care to look in the source
> code of dup2(), you'll see that it calls Fforce().

Get the MiNT-lib. And of course it calls Fforce(), but as it's a library call, you can be sure it works; otherwise, it would be an error in the lib. If you mix library and GEMDOS-calls and this doesn't work, you can't claim it to be the compiler's or the lib's fault.

> PureC doesn't have unistd.h.

MiNT-lib again. Without the MiNT-lib, Pure C isn't able to handle most POSIX-stuff, which dup2() conforms to. It makes the linked executable larger, though, but this shouldn't really matter compared to the benefits you get from using it.

Ciao

Thomas

Put the program idea on paper before actually starting the code, as well
break the code into seperate procedures. I,e startup routine, main
rountine, wait for acommands, decide commands, screen updates, e.t.c.

Netscape is very reliable on Sun Solaris, I don't know about other
implementation,
but I can't complain about it.

The funny thing is that IE has not be completely developped by
Microsoft,
when they realised that it was worth taken Internet seriously (few years
ago),
they licensed some code from Mosaic in order to catch up with Netscape
(That's common practice at Microsoft from MSDOS to FrontPage, the Web
development tool) So from a perfectly reasonnable product, they managed
to slow it down; it also happened with FoxPro.

I would even post a source code snippet that shows the implementation. However, I haven't had the time to look into this more thoroughly, so it may be that I run into trouble.

It works by implementing a new form_do() (which is required by any code that has it's dialogs in windows), in which upon a key stroke first the cursor position is examined if the cursor is any close to the edit field start or end so that a scrolling action were required. I had the TEDINFO field for those field extended to hold the bigger buffer for the whole string, from this buffer upon each scroll action the corresponding part is copied into the te_ptext buffer, objc_edit (end), objc_draw (edit_field), objc_edit (begin), the latter setting the new cursor position. Now it's time to process the key stroke as usual.

I'm not sure yet if I'd implement it such that it scrolls one character each time (which requires scrolling with each additional key stroke), or always five or so characters at once.

Cheers Peter

Yep. I do... It's not that hard to do. Just write down everything you want to do, then go from there. Write the code down, going from regular written parts, to pseudocode, to the actual coding and debugging.

> Whats up ?... no one like Speghetti ? :)))

Yummy!

You got it. Just head to http://www.browsers.com, and start looking. I'm
using one called Opera, and love the sucker. Multiple windows, you can
turn off and on your cache, graphics, that sort of thing. I once tried
using Netscape, the standard installation. Never again.

It took me 15-20 minutes just to get out of it, signoff AOL, and get out
of Windows. Why? Can you say Disk Access Hell? Heavy disk access to hell
and back, and this on a 16 meg machine.

What is that?"

A joke which plays on the use of "pointers", which used to mean
"helpful tips", not "guidance in obtaining further information",
and which is used in programming with a specific technical
meaning- computer pointers are addresses of things in memory.

Yes it has everything to do with it, I can follow whats commonly
termed as "speghetti code", If I can follow it then its maintainable
yes?.. My point being that not everyone writes everything down first
or programs so methodicaly,

yeeeees! :))

Well, I tried to redirect stderr, I tried various things, but it
didn't work. So I thought, I'll ask in this newsgroup, and you answer,
for which I'm very grateful, but then you say something which isn't
correct, and I thought, I'd better tell you, maybe you want to know.
I'm sorry if that offended you.

>Yes, after re-checking the standard libs of PC again, I noticed that

But even if I swith to the MiNT lib, or if I compile my programs with
gcc, I cannot redirect the output to stderr of programs compiled with
PureC. I mean, if I start them with Pexec(). Is it impossible, then?

Yes it is very annoying. However Annoying aside, did he ever get an answer to his question? The topic is pure C and somehow everyone is talking IE and Netscape. If you are going to talkabout Netscape, how about you guys tackling converting the source to the Atari:-). Uwe says it can't be done.

>
>There are about 50 or 60 alternative web browsers available, all of them more

Sure, say like CAB;-) with STing. However works with Atari too. Perhaps if he could get his Pure C version he could write his own better Web Browser.
I am not a programmer, so I will leave now.

Hmmm, I've used Netscape on both Unix and Windows, and never found it causing
excessive disk access. Are you sure the disk access wasn't possibly caused by
something else, maybe related to the AOL account ?

Cheers Peter

No, it says "Basic programming", which I basically (see ?) understood to mean "fundamentals, or basics, of programming". Maybe for native english speakers it was obvious that it did not mean that, I can't tell. ;-)

Sure, maybe if you're used to using BASIC for programming you'd automatically understand that the programming language was meant in the subject.

Maybe, but it certainly looked that way.

> - I'm the kind of person
> who was merely making a suggestion; it was/is an "option".

Well, you suggested a method to use 030 optimized code without needing to care for duplicate code. The latter means, only one version, so the code was not an option for the user, as a non-optimised version won't exist anymore. The optimised version however meant a speed loss for all those machines which need the speed most desperately, i.e. the ones being slow anyway, while just a minor speedup is granted to those who have ample CPU power anyway.

Haven't you thought about this before you wrote your message ?

>>but the whole point of Web browsing in my opinion, is being able to
>>view pictures
>>Web browsing is visual, and what better way of visualizing

>
> I'm not criticizing those of you who still use an ST for Web browsing,
> (it's great that we can) but you have to admit, it isn't the most
> suitable computer (graphically) for viewing the Web.

The most suitable computer (graphically) for viewing the Web is a modern True-Color, at least 1280x1024, Pentium II / Alpha / PowerPC etc. based machine that has enough power to run a Java virtual machine with reasonable speed. From this point of view, TTs or Falcons are only little better than STs.

You don't agree ? Good ! This mainly means that the applicability of a ST or TT for web browsing is a matter of personal preferences and purposes. From this it should be obvious that you should not apply your own judgement on the applicability of STs and TTs for web browsing to other people.

There are lots of users for whom the ST is perfectly capable of browsing the web, simply because they are not as easily impressed by colorful buttons.

>>Should I mention that I do the STinG development on an ST ?
> That's great, and I don't knock you for it, but what relevance does
> it have? I mean, I can use my STe & compiler to generate 040 code if
> I want. I just can't run it. ;-)

And that's why you'll start cursing when you find out that a tool that you most desperatly want to use on your STE is compiled for 040 code. The situation is somewhat similar to what you proposed.

>>> My point being, is that these machines are all 030 or greater, so
>>> why not have a 32-bit version of CAB & ovl for these computers.

>>
>>Which means your point is obsolete, as CAB and all OVLs always have
>>been 32 bit versions.
> Shall I re-phase it for you :-
> ...so why not have 030/040 versions of CAB & OVL for these computers.

Which means your point is wrong, as the underlying assumption ("all machines are 030 or greater") is dead wrong.

> So what's involved in making a 030 version?
>
>   - change the compiler option, (a total of ~2-3 seconds)
>   - wait 5-10 minutes for CAB to compile, (rough guess, could be

>   - upload it (the OVL at least) to a few common ftp sites,
>   - post a brief message to this news group.
>
> By golly gee, that was hard.

Is it a secret feature of CAB that it is able to compile the OVL to be used with it ? :-))

I have nothing against a special 030 version as long as the 68000 version is equally well supported. But I am against a combined version which means a serious speed loss for 68000 based machines. And it's the latter what this thread origins from.

> If we keep writing software for the lowest common denominator (68000),
> then we aren't being very supportive towards these hardware companies
> making 030/040/060 machines.

Why not ? This all means you haven't examined the 68k series of CPUs very thoroughly. You should do that NOW.

95 to 98 percent of the speedup that is possible with a later CPU is still achieved with 68000 code, as all the improvements are purely CPU internal. Only the remaining 2 to 5 percent can be gained by optimised software. This means your statement above is completely wrong. Of course, a 68030 runs 68000 software a lot faster (those 95 - 98 %), this is ample support for the computer engineers. The only support possible by producing optimised software is causing the software to become unsuable on STs this way, thus forcing the people to buy faster hardware. But believe me, the people will choose Intel in that case, not 68030/40/60.

> And I don't imply that the ST is dead,
> because this is far from true. However, "we", as software developers
> need to support the hardware growth, otherwise we might as well live
> back in the late 1980's.

You're not supporting the 68k family of CPUs by producing optimised code.

You're merely driving people to buy Intel.

Even the existence of 030 optimised code can make people feel that their hardware is outdated and insufficient for their needs. That's what I'd feel if the first thing every software docs would point out is that there is "a faster, 030 optimised version" of the software. And whenever such feelings arise in an Atari user, the Atari machine is in danger of being dumped and replaced by a PC.

```

>                    ST's anymore.
```

It had been changed a long time ago it changing a newsgroup's title were so easy.

Cheers Peter

It may well support scrollable edit fields directly like it does other
cool functions but unfortunately it isn't much use if your app is
going to be run on non MagiC systems. It could only be of use if it
were an addon like the "submenu" features required for the likes of
Lattice to work, and compatible with all systems of course!

On second thoughts I agree. There is no need to replace objc_edit().

I don't think they need bother. This'll make all the Cab users who
haven't experienced mie4 very much happier ... ;-)

The "Active Desktop" was the first thing to misbehave and had to be
disabled.

Toggle the "view as web page" checkmark in a desktop window and all
position and sizing information for all desktop windows is lost.

It has always had a flair for missing out the final graphic from
pages.

It now refuses to remember its own window sizes.

When the Frontpage 98 beta expired it disabled the "edit page" option
(for Frontpage Express) and needed a 8 meg download to turn it back on
again whereupon executed Word until I installed it again from scratch
(25Mb).

It stalls (permanently) when ftp'ing multiple files.

The thing that pisses me off most though is the moment it got its
claws into my system the Netscape icon (and no other) vanished from
the Office "desktop" taskbar - methinks that is no 'accident'.

Oh no - I've just thought of the worst one. It has to be installed
after Service Pack 3 and SP3 has to be applied after you install
anything!

[better stop 'cos the list is endless]

Hmm, come to think of it an ActiveX "virus" like you said might do a
better job of getting rid of it!
